QC CERTIFICATE TB18315377

Project: Mine Site Lab Pulps Nov 2018

P.O. No.: 4500023138

This report is for 132 Pulp samples submitted to our lab in Thunder Bay, ON, Canada on 10-DEC-2018.

The following have access to data associated with this certificate:

RAINY RIVER AP TIM SCHWARTZ	JOHN BLIGH	JASON PATTISON

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-23	Pulp Login - Rcvd with Barcode
LOG-QC	QC Test on Received Samples

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
OA-VOL08	Basic Acid Base Accounting	
S-IR08	Total Sulphur (Leco)	LECO
OA-ELE07	Paste pH	
C-IR07	Total Carbon (Leco)	LECO
Au-AA23	Au 30g FA-AA finish	AAS
Au-GRA21	Au 30g FA-GRAV finish	WST-SIM
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

QC CERTIFICATE TB19005962

Project: Mine Site Lab Pulps Nov2018 V2

P.O. No.: 4500023138

This report is for 214 Pulp samples submitted to our lab in Thunder Bay, ON, Canada on 28-DEC-2018.

The following have access to data associated with this certificate:

RAINY RIVER AP TIM SCHWARTZ	JOHN BLIGH	JASON PATTISON

SAMPLE PREPARATION

ALS CODE	DESCRIPTION
WEI-21	Received Sample Weight
LOG-23	Pulp Login - Rcvd with Barcode
LOG-QC	QC Test on Received Samples

ANALYTICAL PROCEDURES

ALS CODE	DESCRIPTION	
OA-VOL08	Basic Acid Base Accounting	
S-IR08	Total Sulphur (Leco)	LECO
OA-ELE07	Paste pH	
C-IR07	Total Carbon (Leco)	LECO
Au-AA23	Au 30g FA-AA finish	AAS
Au-GRA21	Au 30g FA-GRAV finish	WST-SIM
ME-ICP41	35 Element Aqua Regia ICP-AES	ICP-AES

This is the Final Report and supersedes any preliminary report with this certificate number. Results apply to samples as submitted. All pages of this report have been checked and approved for release.

NEW GOLD RAINY RIVER MINE
APPENDIX C
FLEDGLING INCIDENT REPORT

Appendix K:

Species Encounter Reporting Form

Name and position of Observer Phone Number	Garnet Cornell, Maintenance Truck Shop 1-807-0106
Species Observed	Juvenile Barn Swallow
Date and time (EST) of Observation	2018-07-26 1700
Location of Observation {UTM coordinates & description)	Truck Maintenance Shop Zone 15U 426508 5410660
General description of Observation (eg. nest, individual, behaviour)	Thursday late afternoon was found dead in the open box it was placed in.
Actions taken to minimize/mitigate adverse impacts (if required)	Was found on shop floor two days earlier uninjured and was placed in an open box near nest, with hopes that parents would still care for it.

Executive Summary

An Ontario *Endangered Species Act* (ESA) permit for Species at Risk (SAR) was issued to New Gold Inc. (New Gold) for their Rainy River Mine (RRM) by the Minister of Natural Resources and Forestry on November 7, 2014. The ESA permit addresses two provincially threatened bird species, Eastern Whip-poor-will and Bobolink, and allows construction and operation of the RRM. Where adverse effects to Eastern Whip-poor-will and Bobolink habitat were anticipated to occur, New Gold, through provisions of the ESA permit, has provided compensatory habitat referred to as Overall Benefit Areas to offset adverse effects. The ESA permit requires New Gold to manage these Overall Benefit Areas for the benefit of Eastern Whip-poor-will and Bobolink. Management is required until such time as habitat restoration can be demonstrated to be capable of supporting a prescribed number of SAR bird territories, or acreages, as defined in the ESA permit.

A comprehensive monitoring program is defined in Condition 6 of the ESA permit, with reporting requirements for this monitoring program defined in Condition 7. The primary objectives of the monitoring program are to i) quantify any adverse effects to Eastern Whip-poor-will and Bobolink and to confirm that these effects are limited to those identified in the ESA permit, and ii) to confirm that Overall Benefit Areas are functioning to provide the required compensatory offsets. This 2018 Annual Monitoring Report addresses Phases 1 and 2 of the monitoring programs for Eastern Whip-poor-will and Bobolink, as per Appendices G and J of the ESA permit, respectively.

Condition 4.1(g) of the ESA permit also requires sound monitoring to be carried out during the first week in May and June of each year of construction, at two Eastern Whip-poor-will receptor locations (positioned north and south of the Project site) where the highest Project-related sound levels are expected to occur. This report summarizes the results of the 2018 sound monitoring activities (final year of construction) and further details are provided in a separate report (Wood 2018).

Results of Phase 1 and Phase 2 monitoring of Eastern Whip-poor-will and Bobolink as outlined in Condition 6 and Appendix G of the ESA permit are as follows. In 2018, 53 Eastern Whip-poor-will were recorded within the Eastern Whip-poor-will Overall Benefit Areas and 16 individuals were recorded within the Project site boundary or around its periphery. A total of 89 Bobolink individuals were recorded within the Bobolink Overall Benefit Areas. Additional surveys were conducted outside of these areas as part of the Rainy River Mine Wildlife Monitoring Program. These surveys detected one additional Eastern Whip-poor-will, and 17 additional Bobolinks within the Study Area.

Other Species at Risk recorded during the 2018 surveys included (in order of abundance from highest to lowest): Barn Swallow, Wood Thrush, Golden-winged Warbler, American White Pelican, Eastern Wood-Pewee, Canada Warbler, Common Nighthawk, Bald Eagle, Olive-sided Flycatcher, and Evening Grosbeak.

Hourly sound levels were within the criteria limit of L_{eq} 50 dBA for 319 of the 336 hours of data collected at the two receptor locations. During the May 2018 monitoring period, there were two exceedances of the hourly L_{eq} 50 dBA sound criteria threshold due to inclement weather, which occurred at both the North and South Receptor Habitat locations. There was an additional threshold exceedance at the North Receptor due to a combination of mine equipment and wildlife, and another threshold exceedance at the South Receptor due to wildlife. During the June 2018 monitoring, all exceedances (14) that occurred at the North and South Receptor Habitat locations were caused by inclement weather and were not caused by mine activities.

A Whip-poor-will Habitat Receptor Sound Monitoring Report 2018
B New Gold 2018 Species at Risk Observations
C Species at Risk Training Provided to Staff

1.0 Introduction

1.1 Purpose of Application

An Ontario *Endangered Species Act* (*ESA*) permit for Species at Risk (SAR) was issued to New Gold Inc. (New Gold) for their Rainy River Project (RRM) by the Minister of Natural Resources and Forestry (MNRF) on November 7, 2014 (Permit # FF-C-001-14). The ESA permit addresses two provincially threatened bird species: Eastern Whip-poor-will and Bobolink. The permit authorizes construction and operation of the RRM despite anticipated Project-related adverse effects to these two SAR birds, including:

- Destruction of SAR habitat;
- Damage to SAR habitat; and
- Potential harm to and/or harassment of SAR.

Destroyed habitats are defined in the ESA permit to include Eastern Whip-poor-will and Bobolink occupancy areas and habitats that are anticipated to be directly displaced by mine development activities. Examples of mine development activities include open pit mining, the construction of buildings and yard areas, and the establishment of mineral stockpiles and tailings areas.

Sound levels thresholds due to Project-related activities may exceed 50 decibel A-Weighted (dBA). The 50 dBA threshold is defined as the 50 dBA sound level averaged over one hour (50 dBA, L_{Aeq} 1 hr), as determined through standard Ministry of the Environment (MOE; 1977b) NPC-103 monitoring procedures, and excluding blast noise. Frequent or continuous sound levels in excess of 50 dBA have the potential to diminish habitat suitability for sensitive bird species. Therefore, The ESA permit defines damaged habitats as those habitats located adjacent to or near destroyed habitats, where a reduction in habitat suitability is expected to occur over the longer-term, primarily due to Project-related noise emissions.

Short-term increases in noise levels due to Project-related activities are thought to result in potential harm to and harassment of SAR species.

Where adverse effects to SAR habitat were anticipated to occur, New Gold has provided compensatory habitat through provisions of the ESA permit, referred to as Overall Benefit Areas (OB Areas). The ESA permit requires New Gold to manage these OB Areas for the benefit of Eastern Whip-poor-will and Bobolink, until habitat restoration can be demonstrated to be capable of supporting the prescribed number of SAR bird territories, or acreages, defined in the ESA permit.

For Eastern Whip-poor-will, the MNRF determined that 18 identified Eastern Whip-poor-will breeding territories could potentially be affected by mine developments. To offset this effect, New Gold acquired land title (surface rights) to a total of 1,468.3 hectares (ha) of lands having the potential to support approximately 36 Eastern Whip-poor-will breeding territories, providing a 2:1 ratio of offset to affected territories. This 2:1 ratio was set as a conservative measure to account for any uncertainties in the quality or utilization of offset territories by Eastern Whip-poor-will.

In the case of Bobolink, MNRF determined that 348 ha of Bobolink habitat had the potential to be adversely affected by mine developments (destroyed or damaged). To offset this effect, New Gold acquired land surface rights to a total of 348 ha of field habitat considered to be suitable for use as breeding habitat by Bobolink, for protection and management.

To confirm that adverse effects to Eastern Whip-poor-will and Bobolink are limited to those identified in the ESA permit, and that OB Areas are functioning as intended, a comprehensive monitoring program is defined in Condition 6 of the ESA permit. Reporting requirements for this monitoring program are defined in Condition 7.

The monitoring program for Eastern Whip-poor-will includes:

- Phase 1 monitoring to determine whether areas within and adjacent to the Project Site are occupied by Eastern Whip-poor-will during and after construction and operation activities. Phase 1 monitoring shall also include an assessment of sound levels, during the breeding season in identified Eastern Whip-poor-will receptor habitats.

- Phase 2 monitoring of the OB Areas to determine which areas are occupied by Eastern-Whip-poor-will, and to assess the distribution of the areas relative to implemented management actions, as set out in the Management Plan.

- Phase 3 monitoring after implementation of the Eastern Whip-poor-will site rehabilitation plan to determine Eastern Whip-poor-will occupancy rates at the mine site compared with pre-mining condition. Phase 3 monitoring will take place post-closure.

Specific guidance is provided in Condition 6.2 and Appendix G of the ESA permit describing how the monitoring program for Eastern Whip-poor-will is to be carried out. This guidance includes the times during which monitoring is to be carried out, qualifications of the monitors, and information to be collected.

The monitoring program for Bobolink includes:

- Phase 1 monitoring to determine the response of Bobolink to construction and operation activities within the Project site and within the adjacent occupancy areas;

- Phase 2 monitoring to determine habitat use by Bobolink within the OB Areas; and

- Phase 3 monitoring after implementation of the Bobolink rehabilitation plan to determine Bobolink occupancy rates at the mine site compared with pre-mining occupancy rates. Phase 3 monitoring will take place post-closure.

Specific guidance is provided in Condition 6.4 and Appendix J of the ESA permit outlining how the monitoring program for Bobolink is to be conducted. Guidance includes the times during which monitoring is to be carried out, qualifications of the monitors, and information to be collected.

This 2018 annual monitoring report addresses both Phase 1 and Phase 2 of the monitoring programs for Eastern Whip-poor-will and Bobolink. Phase 3 monitoring is not required until post-closure, following site rehabilitation, and accordingly is not described herein.

1.2 Table of Concordance

This report has been submitted to the MNRF within six months following the last survey of the 2018 survey sequence (as per Condition 7.2) and has been prepared in accordance with Condition 7.3 (Table 1-1).

2.0 Summary of Construction Activities Undertaken

Condition 7.3(e) requires descriptions of operation and construction activities undertaken in 2018 and these activities are shown as equipment operating hours in Table 2-1 and further detailed with status and completion dates in Table 2-2.

3.0 Habitat Management and Assessment Criteria

3.1 Adaptive Management

A key component of the monitoring program is adaptive management whereby ongoing results of the monitoring program are used to inform response strategies. In the case of SAR monitoring for the RRM, it is anticipated that monitoring results will:

- Confirm sound level predictions in relation to damaged habitats; and
- Confirm Eastern Whip-poor-will and Bobolink occupancies within and adjacent to the Project site.

If Project-related sound levels in Eastern Whip-poor-will receptor habitat should exceed sound level thresholds defined in the ESA permit, additional mitigation measures will be implemented to reduce sound levels in accordance with Condition 4.1(g) and 4.2(b) of the ESA permit.

Should Eastern Whip-poor-will and Bobolink occupancies in areas peripheral to the Project site be diminished in comparison to historic and control data (where available), including allowances for increased sound levels in damaged and harmed and harassed areas, New Gold will investigate the basis for any such diminished use. If related to Project operations, New Gold will attempt to mitigate any related adverse effects.

3.2 Habitat Creation Criteria

3.2.1 Eastern Whip-poor-will

Habitat creation objectives (criteria) for Eastern Whip-poor-will apply to mine site reclamation following the completion of mining and to rehabilitation of the Tait Quarry. Habitat management within the OB Areas is considered separate from habitat creation criteria. Habitat creation criteria for the development of Eastern Whip-poor-will habitat at closure includes:

- Habitat restoration to include provision for the creation of 13 Eastern Whip-poor-will territorial males, with the average territory being approximately 30 ha; and
- Habitat to be developed as self-sustaining, patchy forest habitat, consisting of an interspersed mix of mid-successional to mature trees and open patches, with limited to sparse understory development within forest patches.

The criterion of 13 male territories is defined in the ESA permit. Details of the idealized patchy forest type (or types) for reclamation targets will be developed through the Research Program. In 2017, macro- and micro-habitat features were compared between occupied OB Areas and Project Lands and unoccupied adjacent lands. The description of these macro- and micro-habitat features were documented and will be used to refine habitat creation criteria.

3.2.2 Bobolink

Bobolink habitat preferences are well understood. Habitat creation criteria for this species, are the following:

- The quantity of Bobolink habitat developed at closure is to be equal to or greater than that which is destroyed as a result of Project development; and

- Habitat is to be developed and maintained as late maturing grass hayfields, with at least one grass species that is greater than 50 cm in height, and devoid of invasive woody species.

3.3 Habitat Management Criteria

3.3.1 Eastern Whip-poor-will

The following habitat management mitigations were developed, as per Conditions 4.1 and 4.2 of the ESA permit to manage habitat for Eastern Whip-poor-will in the Project site and adjacent area:

- Avoid Project-related tree clearing during the breeding season, defined as occurring from May 1 to August 15 (criterion for success – timing windows adhered to).

- Where practicable, limit tree clearing in advance of, or following, the breeding season, to those areas which are needed for Project development in the near to intermediate term, as per Appendix E of the ESA permit (criterion for success – area of tree clearing consistent with associated construction works development need).

- To the extent reasonably possible, retain landscape topography and nature features (e.g., tree growth) around the perimeter of the Project development area (criterion for success – perimeter topography and features retained).

- Manage Project generated sound levels during the breeding season, such that sound levels do not exceed 50 dBA within whip-poor-will receptor habitats, as defined in the ESA permit (criterion for success – no Project related exceedances of the hourly L_{eq} 50 dBA sound criteria threshold at receptor habitats).

- During the breeding season, ensure that blasting is carried out during the daytime only, defined as extending from a half hour after sunrise to a half hour before sunset (criterion for success – blasting carried out within the prescribed time interval).

- To the extent possible, and taking worker safety into consideration, direct Project related lighting inwards towards Project development areas, and away from the Project site perimeter (criterion for success – lighting directed inwards to extent practicable).

- Use applicable dust control measures to avoid excessive dust suppression on Eastern Whip-poor-will receptor habitats, as defined in the ESA permit (criterion for success – total suspended particulate levels consistent with air quality model prediction for total particulate material).

The applicable above mitigation measures for Eastern Whip-poor-will were employed, resulting in habitat management criteria being met in 2018, during site development.

Habitat management criteria for the OB Areas will be developed as part of the Management Plan for the Eastern Whip-poor-will Overall Benefit Areas, to be submitted to the MNRF by January 28, 2019.

3.3.2 Bobolink

The following habitat management criteria have been developed for Bobolink habitat management in the Project site and adjacent area, as per Conditions 4.1 and 4.2 of the ESA permit:

- Avoid Project-related habitat removal during the breeding season, which occurs from May 1 to July 31 (criterion for success – timing windows adhered to); and
- Manage Project-generated noise levels during the breeding season to below 50 dBA, as defined in the ESA permit, within proximal high quality Bobolink habitats to the south and west of the Project site.

All of the above mitigation measures as applicable were employed / habitat management criteria were met for Bobolink, during 2018 in connection with site development and operations.

3.4 Effectiveness

All habitat management criteria related to Eastern Whip-poor-will and Bobolink were met without incident in 2018.

4.0 Methods

This 2018 Annual Monitoring Report addresses Phases 1 and 2 of the monitoring programs for both Eastern Whip-poor-will and Bobolink, as per Appendices G and J of the ESA permit, respectively.

4.1 Eastern Whip-poor-will Surveys

Surveys were conducted in accordance with the survey protocol provided by the Whip-poor-will Roadside Survey Participant's Guide (BSC 2012). Surveys commenced 30 minutes after sunset and continued until approximately midnight or 1:00 am (depending on weather conditions, brightness of the moon, and level of singing activity by the birds). All survey stations were sampled at least once per round on calm, clear nights with little or no cloud cover, no precipitation and winds of no greater than 3 on the Beaufort Scale.

Eastern Whip-poor-wills are known to call most actively during periods of high lunar illumination, when at least 50% of the moon face is illuminated (Mills 1986; Wilson and Watts 2006). Accordingly, the two survey rounds completed during 2018 were scheduled to coincide with periods of greatest lunar illumination. Surveys were conducted between the first and third quarters of the lunar cycle, both in late May and June, during the Eastern Whip-poor-will breeding period. These lunar phases occurred between May 26 and June 6, and between June 20 and July 6, 2018. The 2018 Eastern Whip-poor-will surveys at RRM were conducted from May 29 to June 4 and from June 21 to June 27, 2018. Survey stations (Figure 4-1) visited during the first round of surveys were repeated to determine whether birds occurring in late May and early June were still present in late June, and therefore assumed to have established breeding territories.

A total of 101 stations were surveyed for Eastern Whip-poor-will, where:

- 24 stations were located near the proposed mine site footprint (e.g., within the footprint or within 3 kilometres (km) of the footprint); and
- 77 stations were located within Eastern Whip-poor-will OB Areas (Figure 4-1).

Surveys lasted six minutes at each station, and for each Eastern Whip-poor-will heard, distance and direction to the bird from the survey station were recorded on high resolution aerial imagery and data sheets. In most cases, the bird's location was determined by triangulating from additional survey locations during the survey.

Upon the completion of field studies, Eastern Whip-poor-will field data was analyzed to determine the approximate location of occupied areas and to estimate the number of birds present. Eastern Whip-poor-will locations were compared between repeated visits and between adjacent survey stations in an effort to accurately establish whether recorded observations were repeats of the same bird.

4.2 Bobolink Surveys

Point count surveys for Bobolink were undertaken at predetermined long-term monitoring stations located within the Bobolink OB Areas. As per the monitoring schedule outlined in Appendix J of the ESA permit, Bobolink surveys were not required at long-term monitoring stations located within the Project site or around its periphery in 2018. Surveys were conducted according to protocols described in *Mining*

Project Baseline Desktop Assessment and Survey Requirements (Environment Canada 2014) and the Ontario Breeding Bird Atlas (OBBA; 2001).

Two rounds of point count surveys were conducted between June and July 2018 by qualified biologists skilled in the identification of birds by sight and sound. Surveys were initiated prior to sunrise and extended to 5 hours after sunrise, depending on the weather conditions. Surveys were conducted during dry atmospheric conditions (no precipitation) and winds of no greater than 3 on the Beaufort Scale. Surveys lasted 10 minutes at each point count station and all birds seen or heard within four distance regimes (0 to 50 m; 50 to 100 m; outside 100 m; and birds seen flying overhead) were recorded. Bird observations were also recorded within three time intervals: (0 to 3 minutes, 3 to 5 minutes, and 5 to 10 minutes).

A total of 43 point count stations were surveyed within Bobolink OB Areas in 2018 (Figure 4-2). Point count stations were previously established using digital Forest Resource Inventory (FRI) imagery and satellite imagery and were stationed approximately 250 m apart from each other to maximize coverage and minimize overlap. Stations were geo-referenced in the field using a hand-held Global Positioning System (GPS) unit with 5 m accuracy. The first round of surveys was conducted on May 30 to 31 and between June 2 and 5, 2018. The second round of surveys was conducted on June 22 and June 5 to 6, 2018. During the second round of sampling, stations were surveyed in the reverse order from the first round to reduce temporal sampling bias.

4.3 Eastern Whip-poor-will Sound Monitoring

Condition 4.1(g) of the ESA permit provides for sound monitoring to be carried out at two Eastern Whip-poor-will receptor habitats where the highest sound levels are expected to occur. Sound monitoring is to be completed during the first week in May and June of each year of construction. Sound monitoring in 2018 occurred from May 1 to 7 and June 1 to 7 at two monitoring locations specified in the ESA permit (Figure 4-3). For monitoring rounds, hourly L_{eq} sound levels were measured and compared with the 50 dBA criteria limit for the assessment, following technical requirements set out in MOE guidelines NPC-102 (MOE 1977a) and NPC-103 (MOE 1977b), and as defined in the ESA permit. Measurements taken during periods of inclement weather (wind velocities above 20 km/hour or relative humidity greater than 90%) were noted. Microphones recorded sound types during the program to support later interpretation of the data.

A summary of the 2018 sound monitoring results are presented in the sections below. Detailed methodology and results are provided in a separate report (Wood 2018), attached as Appendix A.

5.0 Results

5.1 Eastern Whip-poor-will Observations within and Peripheral to the Mine Site (Phase 1 Monitoring)

Figure 5-1 shows the results of the two 2018 Eastern Whip-poor-will surveys. Figures 5-1b, 5-1c and 5-1d show the survey results from within or around the periphery (within 3 km) of the Project site, satisfying the requirements of Phase 1 of Eastern Whip-poor-will monitoring (*…monitoring to determine whether, during and after construction and operation activities, that areas within and peripheral to the Project Site are occupied by Eastern Whip-poor-will*), as outlined in Condition 6 and Appendix G of the ESA permit.

The results shown in Figures 5-1b to 5-1d indicate that only one Eastern Whip-poor-will core range overlapped the Project footprint (Figure 5-1c). One additional Eastern Whip-poor-will individual was located within the Project site boundary (Figure 5-1c), and fourteen individuals were located outside of the Project site boundary but within the periphery of the Project footprint (eight in Figure 5-1b, four in Figure 5-1c and three in Figure 5-1d). Therefore, a total of seventeen Eastern Whip-poor-wills were recorded within the Project site or around its periphery in 2018 (Table 5-1).

This is the fourth consecutive year that surveys have been conducted at these precise survey stations (Figures 4-1; Table 5-1). A total of 19, 14, and 9 Eastern Whip-poor-wills were recorded at these same sites during surveys completed between 2015 and 2017 (Figure 5-2; Table 5-1), with many individuals being recorded in similar locations between years.

Eastern Whip-poor-will occupancy decreased in the area to the southeast of the Project boundary from 11 individuals in 2015 to 2 individuals in 2017 and 4 individuals in 2018. (Figure 5-2; Table 5-1). West of the Project footprint, the number of individuals decreased from three in 2015, to one in 2016, with no birds recorded in 2017 or 2018 (Figure 5-2b; Table 5-1). Eastern Whip-poor-will occupancy rates in the area to the northeast of the Project Footprint have stayed relatively consistent (Figure 5-2c). Surveys at these precise survey stations were not undertaken prior to 2015, though the general Project area (the Project footprint and surrounding areas) was well studied in 2010 to 2013 (AMEC 2011, 2012, 2013; KCB 2011; MNR 2013a; Amec Foster Wheeler 2014; Rand 2014; see Figure 5-3).

5.2 Eastern Whip-poor-will Observations within the Overall Benefit Areas (Phase 2 Monitoring)

Figures 5-1a and 5-1b show the results of the 2018 Eastern Whip-poor-will surveys within the two OB Areas, satisfying the requirements of Phase 2 of the Eastern Whip-poor-will monitoring (*…monitoring of the OB Areas to determine which areas are occupied by Eastern-Whip-poor-will*), as required by Condition 6 and Appendix G of the ESA permit.

A total of 29 Eastern Whip-poor-wills were recorded in the northern OB Area (Figure 5-1a) during the first 2018 survey round and 38 individuals were recorded in the second survey round. Birds observed during both rounds (15 individuals) were considered to be established territorial males (Table 5-2). This is the fourth consecutive year that surveys have been conducted at these locations. During the surveys from 2015 to 2017, the number of individuals recorded in the first and second rounds were 11 and 11, 14 and 27, and 29 and 27, respectively (Wood 2017; Figure 5-2a; Table 5-2). Surveys at these precise survey stations were not conducted prior to 2015, but the northern OB Area was well studied in 2010 to 2013 (AMEC 2012, 2013; MNR 2013a; AMEC 2014; Rand 2014; see Figure 5-3).

In the southern OB Area (Figure 5-1b), six Eastern Whip-poor-wills were recorded during the first round and six were observed during the second round (Table 5-2). Similar to the northern OB Area, birds observed during both rounds were considered to be established territorial males. This is also the fourth consecutive year that surveys have been conducted at these precise survey stations in the southern OB Area (e.g., the survey stations shown in Figures 4-1). During the surveys from 2015 to 2017, the number of individuals recorded in the first and second rounds were 11 and 11, 6 and 12, and 10 and 7, respectively (Wood 2017; Figure 5-2b; Table 5-2). Surveys at these precise survey stations were not conducted prior to 2015 but the southern OB Area was well studied in 2010 to 2013 (AMEC 2012, 2013; MNR 2013a; AMEC 2014; Rand 2014; per Figure 5-3).

These results indicate that at least 17 Eastern Whip-poor-will occupied the two OB Areas in 2018. As such, the OB Areas are functioning as intended to provide the required offsets.

5.3 Rainy River Mine Wildlife Monitoring Program

Concurrent with Eastern Whip-poor-will surveys within the OB Areas and within and peripheral to the Project site, morning bird surveys were conducted at control and impact sites located within the Project site or around its periphery as part of the RRM Wildlife Monitoring Program. One additional Eastern Whip-poor-will was detected at one of the morning bird survey locations.

5.4 Eastern Whip-poor-will Sound Monitoring

Sound level monitoring was carried out in two Eastern Whip-poor-will Receptor Habitats (Figure 4-3) during the first weeks of May and June 2018 as described in Section 4.3, and as required by Phase 1 of Eastern Whip-poor-will monitoring outlined in Condition 6 of the ESA permit. Monitoring results are presented in Table 5-3 and detailed discussions of these results are presented in Appendix A.

The hourly sound levels were within the criteria limit of L_{eq} 50 dBA for 319 of the 336 hours of data collected at the receptor locations. During the May 2018 monitoring period, there were two exceedances of the hourly L_{eq} 50 dBA sound criteria threshold which occurred at both the North and South Receptor Habitat locations, due to inclement weather. There was an additional threshold exceedance at the North Receptor due to a combination of mine equipment and wildlife, and another threshold exceedance at the South Receptor due to wildlife. During the June 2018 monitoring, all exceedances (14) that occurred at the North and South Receptor Habitat locations were caused by inclement weather and were not caused by RRM activities.

5.5 Bobolink Observations within and Peripheral to the Mine Site (Phase 1 Monitoring)

As per the monitoring schedule outlined in Appendix J of the ESA permit, Bobolink surveys were not required within the Project site or around its periphery in 2018 and were only conducted within the OB Areas.

5.6 Bobolink Observations within the Overall Benefit Areas (Phase 2 Monitoring)

Figure 5-4 shows the results of the two 2018 Bobolink surveys, including the Bobolink OB Areas, satisfying the requirements of Phase 2 of Bobolink monitoring ("*…monitoring to determine habitat use by Bobolink within the OB Area*"), as outlined in Condition 6 and Appendix J of the ESA permit.

There was a total of 89 Bobolink observations in the Bobolink OB Areas in 2018. Birds were observed in all but five of the OB Areas, three illustrated in Figure 5-4 and two additional OB Areas located to the northwest (Figure 4-2). Bobolink nesting took place from late May to late July and fledging occurred in June and August, consistent with previous years.

This is the fourth consecutive year that surveys have been conducted at these precise survey stations. During both the 2015 and 2016 surveys 94 Bobolinks were observed in the OB Areas, and in 2017, 65 Bobolinks were observed in the OB Areas (Table 5-4, Figure 5-5). In 2015, Bobolink were observed in all but three of the OB Areas, in 2016 they were absent in seven of the OB Areas, and in 2017 they were absent in five of the OB Areas (Figure 5-5). In 2018, they were absent in five of the OB Areas. Surveys at these precise survey stations were not conducted prior to 2015, however the general Project area (footprint and surrounding areas) was well studied in 2010, 2011 and 2012 (AMEC 2011, KCB 2011, AMEC 2012, MNR 2013b, AMEC 2014; Figure 5-6).

These survey results indicate that the OB Areas are functioning as intended to provide the required offsets.

5.7 Rainy River Mine Wildlife Monitoring Program

Concurrent with Bobolink surveys within the OB Area, morning bird surveys were conducted at control and impact sites located within the Project site or around its periphery as part of the RRM Wildlife Monitoring Program. An additional 17 Bobolinks were detected at 9 locations during the morning bird surveys.

5.8 Other Species at Risk Observations

Other SAR observations within the study area were recorded both incidentally and during the following three surveys in 2018:

- Morning point count surveys for Bobolink;
- Crepuscular bird surveys for Eastern Whip-poor-will; and
- Morning point count surveys for the overall RRM Wildlife Monitoring Program (Amec Foster Wheeler 2015, 2016);

The following observations were made (also see Figure 5-7 and Table 5-5):

- A total of 22 American White Pelicans (listed provincially as threatened, not listed federally) were recorded at five point count locations. Small flocks (2 to 15 birds) were also incidentally observed flying over the study area during surveys periods in late May and June.

- Two Bald Eagles (listed provincially as special concern, not listed federally) were recorded at a nest site at a single point count location, and three others were observed at three separate point count locations.
- A total of 71 individual Barn Swallows (listed provincially and federally as threatened) were recorded at seven point count sites.
- Twelve Canada Warblers (listed provincially as special concern, listed federally as threatened) were recorded at 11 point count locations.
- Nine Common Nighthawks (listed provincially as special concern, listed federally as threatened) were recorded at six crepuscular bird survey stations.
- Twelve Eastern Wood-pewee (listed provincially and federally as special concern) were recorded at eleven point count locations.
- Three Evening Grosbeak (listed provincially as special concern, not listed federally) were recorded at one point count location.
- Twenty-six Golden-winged Warblers (listed provincially as special concern, listed federally as threatened) were recorded at 22 point count locations.
- Four Olive-sided Flycatchers (listed provincially as special concern, listed federally as threatened) were recorded at 4 point count locations.
- Twenty-nine Wood Thrush (listed provincially as special concern, listed federally as threatened) were recorded at 26 point count locations.

Other SAR observations recorded in 2015 to 2017 (Wood 2017) are shown in Figure 5-8 and summarized in Table 5-5.

Four Barn Swallow nest structures erected as habitat compensation in the winter of 2015 were checked by Wood biologists for evidence of nesting in June and July, 2018. No evidence of current nesting activities in these structures was observed. As previously reported, a nesting attempt had been observed on July 28, 2016 at Structure D; however, this nest was abandoned.

Evidence of Bank Swallow nests were observed by New Gold on June 5, 14 and 20, 2017 but no birds were observed in 2018 (Figure 5-8). It is possible that birds were foraging away from the nests at the time of the observations, but it is more likely that these nests are inactive nests from previous years.

New Gold personnel also documented 77 observations of SAR in 2018, as detailed in Appendix B and in the New Gold monthly SAR reports.

6.0 Summary of Habitat Management Activities Undertaken

6.1 Tait Quarry

The ESA permit specifies a process to use the RRM Tait Quarry closure as an Eastern Whip-poor-will habitat reclamation study, the results of which can guide the development of a site-wide RRM Eastern Whip-poor-will Site Rehabilitation Plan to be implemented at closure of the RRM. A detailed closure and reclamation plan was submitted to the MNRF in October 2017, outlining closure activities and earthworks commenced in November 2017. Revegetation activities were completed in August of 2018.

6.2 Project Site

Project site development during 2018 has met substantial completion, little to no further clearing is required. The underground mining operation and development of the portal began in 2018 as well as the completion of Cell 3 Dam, Water Discharge Pond, Sediment Ponds 1 and 2 and clearing for Constructed Wetland.

In 2017, the progressive reclamation process began, where possible, and approximately 137 ha were reclaimed, including parts of the following Project components:

- Clark Pond and diversion;
- Teeple Pond and diversion;
- West Creek Pond and diversion;
- Stockpile Pond and diversion;
- East Access Corridor;
- Areas south of Sump #1; and
- Tait Quarry.

SAR habitat management activities for the Project site area in 2018 were essentially restricted to limiting tree clearing to those areas where such clearing was necessary to allow Project site development.

6.3 Eastern Whip-poor-will Overall Benefit Areas

In accordance with Condition 5.1(b)(ii) of the ESA permit, a Management Plan for the Eastern Whip-poor-will OB Area is to be submitted to the MNRF by January 28, 2019 and this plan is to be approved by MNRF by January 28, 2020. Until the Eastern Whip-poor-will OB Area Management Plan is approved, no physical work is scheduled to be undertaken within the OB Areas. As such, no habitat management activities were undertaken in the Eastern Whip-poor-will OB Areas in 2018.

In September 2017, the MNRF requested a comparison of aerial imagery of the Eastern Whip-poor-will OB Areas from 2014 (when these lands were purchased by New Gold) and 2017 (when new aerial imagery became available). Comparative images were examined and no changes in the habitat were found within the OB Areas between 2014 and June 2017 (Wood 2017).

6.4 Bobolink Overall Benefit Areas

Condition 5.3(a) states that New Gold shall maintain and enhance "at least 348 hectares of land that will be managed as Bobolink habitat in accordance with the sites delineated in Appendix I", with such maintenance and enhancement to include:

- Bobolink OB Areas 3, 4, 5, and 7 to 21 totaling 317.5 ha to be managed from the ESA permit Effective Date (January 28, 2015); and
- With Bobolink OB Areas 1, 2 and 6 totaling 30.5 ha to be converted to suitable Bobolink habitat within two years of the ESA permit Effective Date (by January 28, 2017).
- All Bobolink OB Areas that were suitable for haying in 2018 were hayed. However due to poor weather conditions in the fall Areas 7, 17, 20 and 21 could not be hayed.

Bobolink OB Areas 2 and 6 were cleared of woody vegetation in 2017 and have been planted in the spring of 2018 with an appropriate grass mix to establish suitable habitat for Bobolink in these areas. Bobolink OB Areas 2 and 6 were seeded in late June 2018 and expected to achieve suitable habitat in 2019.

As specified in the ESA permit, all Bobolink OB Areas are to be maintained as hayfields in conditions suitable for Bobolink, consisting of late maturing grasses with at least one grass species that exceeds 50 cm in height under normal growing conditions, and fields void of woody species. Bobolink OB Areas require periodic renewal through ploughing and replanting, as per normal agricultural practice, to maintain the grasslands and to prevent invasion by woody species which would otherwise degrade the habitat. Haying (hay removed) and mowing (grass left in the field) was first implemented by New Gold in late August and mid-November 2016. To date, no recommendations on the field renewal process have been received from the MNRF nor ECCC.

7.0 Summary of Mortality Events and Associated Adaptive Management Measures

Section 7.3 of the ESA permit requires the reporting of any SAR mortalities occurring within the Project site or OB Areas. In 2018 one SAR mortality event was documented and reported to the MNRF and ECCC. On July 26, 2018, a juvenile Barn Swallow (listed provincially and federally as threatened) was found deceased at the truck maintenance shop.

Table 1-1: Table of Concordance for Permit Condition 7.3

Permit Condition 7.3	Monitoring Reporting Conditions	Relevant Section of 2018 Species at Risk Report
(a)	A summary of survey protocol used	Section 4.0 Methods
(b)	All information collected pursuant to Conditions 4.1(f), 4.2(a), 6.2(f) and 6.4(e).	4.1 (f) and 4.2 (a): not relevant; no Eastern Whip-poor-will or Bobolink observed nesting within Project Site. 6.2 (f) and 6.4 (e): excel spreadsheets with Eastern Whip-poor-will and Bobolink survey data submitted separately to MNRF. Figure 4-1: 2018 Eastern Whip-poor-will Survey Stations. Figure 4-2: 2018 Bobolink Survey Stations.
(c)	an analysis of monitoring results for the specified survey sequence including an estimate and illustration of site occupancy.	Section 5.0 Results. Figure 5-1: 2018 Eastern Whip-poor-will observations. Figure 5-4: 2018 Bobolink observations.
(d)	A summary of any habitat management activities taken.	Section 6.0 Summary of Habitat Management Activities Undertaken.
(e)	A summary of any Operation Activities that occurred within the Project Site during the previous year. If relevant, the report shall include information related to: i. Dates that the activities took place; ii. Duration of the activities iii. Location and extent of the activities; and iv. Nature of the activities (e.g., blasting, stockpiling, etc.).	Table 2-1 Operation Activities Undertaken in 2018.
(f)	With respect to Eastern Whip-poor-will: i. An assessment of the quality and functionality of habitat rehabilitated, created, enhanced or managed in accordance with this permit, including an estimate and illustration of the number of occupancy areas located at the Project Site, and the Eastern Whip-poor-will Overall Benefit Area. ii. A description of Acoustic Audits and any abatement measures implemented.	i. Section 5.0 Results. ii. Sections 4.3 and 5.4 Sound Monitoring. Table 5-3 Eastern Whip-poor-will Receptor Habitat Sound Monitoring Results. Appendix A Whip-poor-will Habitat Receptor Sound Monitoring Report 2018.
(g)	With respect to Bobolink: i. A summary of Bobolink Overall Benefit Area occupancy, nesting periods and fledgling dates through the survey sequence, contrasted with past sequences. ii. A summary of recommendations received, and technical data on field productivity and state of management used to support decisions on Renewal	i. Occupancy, nesting periods and fledging dates noted. ii. Section 6.4 Bobolink Overall Benefit Areas
(h)	The criteria by which the Permit Holder assessed the success of the habitat creation and/or management measures, and statement on the effectiveness.	Not applicable during current reporting period.

Permit Condition 7.3	Monitoring Reporting Conditions	Relevant Section of 2018 Species at Risk Report
(i)	An assessment of impacts of succession, or management of vegetation communities.	Not applicable during current reporting period.
(j)	Within an appendix of the report, a summary regarding training provided to staff as described under Condition 4.3.	Appendix C: Record of Species at Risk Training Provided to Staff.
(k)	Within an appendix, a summary of any mortality events occurring either at the Project Site or the Species Overall Benefit Areas and where applicable the AEWHA(s), and adaptive management considerations that may minimize future mortality events.	Section 7.0 Summary of Mortality Events and Associated Adaptive Management Measures
(l)	For all species listed on the Species at Risk in Ontario List observed within the Project Site, the Permit Holder shall submit a Species Encounter Reporting Form, within 30 days of the encounter or observance.	Appendix B: New Gold 2017 Species at Risk Observations.

Table 2-1: Equipment Operating Hours in 2018

Equipment	Operating Hours
Dozers	172,858
Excavators	129,558
Graders	40,662
Loaders	19.734
Packers	18,018
Rock Trucks	177,606
Mechanical & Service Trucks	150,150
Fuel Trucks	12,012
Miscellaneous Pick-up Trucks	117,702
Drills	43,967

Table 2-2: Operation Activities undertaken in 2018

Construction Activities	Status	Start	End	Comments
Water Discharge Pond	Complete	August 2018	September 2018	Earthworks at the Water Discharge Pond for construction of the dam, spillway and associated haul roads required.
WMP Seepage Collection System	Complete	April 2018	August 2018	Earthworks at the TMA North Dam associated with completing the seepage collection pond, ditch, finger drains, sumps, spillways, drainage pipes and required haul roads.
West Creek Diversion (Removal of Temporary Structures + Stabilization)	Complete	August 2018	October 2018	Earthworks associated diverting the West Creek including the removal of existing culverts, installation of a low flow channel, completion of berms, channels, plugs and stabilization works.
Sediment Ponds	Pending Items	April 2018	November 2018	Earthworks at Sediment Ponds 1 and 2 for construction of the dam, pond, spillway, ancillary hydraulic structures and associated haul roads Repairs to be completed in Spring 2019.
TMA Lifts – Filter Sand	Complete	January 2018	November 2018	Contractors providing sand and crushed rock necessary for Dam raises.
TMA Stage 1 (Cell 2 Construction including Instrumentation)	Complete	January 2018	July 2018	Earthwork activities to raise Dam for Cell 2 to an elevation of 366.5.
TMA Stage 1 (Cell 3 Construction including Instrumentation)	Complete	April 2018	October 2018	Earthwork activities to raise Dam for Cell 3 to an elevation of 366.6.
Clearing of TMA	Complete	--	--	Tree activities throughout TMA footprint.
TMA Fencing – Long Term (Deer)	Ongoing	October 2018	May 2019	Bottom portion of fence to be completed after winter thaw (May 2019).
Site Plant Lighting	Complete	January 2018	October 2018	Engineering, supply and installation of 16 LED lights (including all required hardware, transformers, poles etc.) throughout the Plant Site area.

Table 5-1: Summary of Eastern Whip-poor-will Observations within and Peripheral to the Mine Site 2015-2018 (Phase 1)

Number of Eastern Whip-poor-will Observed			
2015	**2016**	**2017**	**2018**
8 in Project Site 11 around	7 in Project Site 7 around	1 in Project Site 8 around	*2 in Project Site* *14 around*

Table 5-2: Summary of Eastern Whip-poor-will Observations within Overall Benefit Areas 2015-2018 (Phase 2)

Number of Eastern Whip-poor-will Observed			
2015	**2016**	**2017**	**2018**
11 in North 11 in South	27 in North 12 in South	29 in North 10 in South	*43 in North* *10 in South*

Table 5-3: 2018 Eastern Whip-poor-will Receptor Habitat Sound Monitoring Results

Monitoring Results	North Receptor	South Receptor
May 1 to May 7		
Total hourly data records	168	167
Hourly data records with inclement weather	42	42
Hourly data records without inclement weather	126	125
Number of exceedances of the hourly Leq 50 dBA threshold – all data	2	2
Number of exceedances of the hourly Leq 50 dBA threshold – not due to inclement weather condition*	1	1
June 1 to June 7		
Total hourly data records	168	168
Hourly data records with inclement weather	80	80
Hourly data records without inclement weather	88	88
Number of exceedances of the hourly Leq 50 dBA threshold – all data	10	11
Number of exceedances of the hourly Leq 50 dBA threshold – not due to inclement weather condition*	0	0

Note:
Data taken from Amec Foster Wheeler (2018)
* Exceedance caused by birds chirping and/or other wildlife activities (not caused by Project-related activities)

Table 5-4: Summary of Bobolink Observations within Overall Benefit Areas 2015-2018 (Phase 2)

Attn: Sylvie St. Jean, Environmental Manager

Dear Sylvie St. Jean,

RE: 2018 Whip-Poor-Will Habitat Receptor Sound Monitoring Program

Wood Environment & Infrastructure Solutions, a Division of Wood Canada Limited (hereinafter referred to as Wood), is a leading environment and infrastructure, engineering, consulting and project management organization. Our team of professionals provides a full range of services to clients in a wide range of sectors including government, industrial & commercial, water, transportation, minerals & metals, oil & gas clients and clean energy. Environment and Infrastructure's core competencies are in environmental assessments, health and environmental risk assessment, environmental geology (site investigation), remediation engineering, geotechnical engineering and testing, and water resource services.

Wood is pleased to submit to New Gold Inc. (New Gold) the attached report summarizing the results of the 2018 whip-poor-will habitat sound monitoring program at the Rainy River Mine. The monitoring program was undertaken during the weeks of May 1-7 and June 1-7, 2018.

Wood appreciates the opportunity to provide support to the Rainy River Mine. Should you have any questions regarding this report, please do not hesitate to contact the undersigned.

Sincerely,
Wood Environment & Infrastructure Solutions
a Division of Wood Canada Limited

Executive summary

The Rainy River Mine (RRM) is located approximately 65 kilometres by road, northwest of Fort Frances in northwestern Ontario. Wood Environment & Infrastructure Solutions (Wood) was retained by New Gold Inc. (New Gold) to complete a sound monitoring study at two Eastern Whip-poor-will habitat receptor locations adjacent to the RRM site. The sound monitoring study is required by the Ministry of Natural Resources and Forestry *Endangered Species Act* Overall Benefits Permit No. FF-C-001-14 (the Permit).

During the field program, the RRM was transitioning from the development phase to the operational phase. The main activities associated with the operations at the time were aggregate extraction, material handling, vehicle movement, plant operations, crushing operations and other mining fleet operations. The Permit requires monitoring sound levels at two whip-poor-will habitat receptor areas near the RRM site every year during the beginning of May and June. The purpose of this sound monitoring study is to confirm that the RRM construction and operational sound levels are within the Sound Level Threshold (50 dBA (A-weighted decibels)), as specified in the Permit. This assessment was completed by Qualified Professionals as required by the Permit under Sections 3.1 and 4.1(g).

Bruel & Kjaer 2250E Class 1 integrating sound level meters were used for the sound level measurements. The monitors were set to automatically measure the A-weighted hourly energy equivalent sound level (L_{Aeq-1h}) and to continuously record audio. Monitored sound levels can be affected by meteorological conditions and to account for this influence, weather data was obtained from the RRM's Barron site weather station to identify periods when monitored sound levels could have been affected.

Measurements were conducted during regular site activities required for the transition from the development to the operational phase. The sound levels collected during periods of inclement weather were not considered for this assessment, but were reported.

The hourly sound levels were within the Sound Level Threshold for 331 out of 336 hours of data collected at the receptor locations. One exceedance hour revealed contributions from both RRM equipment and wildlife; however, it is inconclusive as to which source was the cause of the exceedance. A review of the remaining exceedances' audio files revealed they were caused by either wildlife activities or wind. As the recordings did not reveal any exceedances which were primarily caused by the RRM site-related activities, the sound levels measured at the whip-poor-will receptor locations are believed to have been in compliance with the 50 dBA Sound Level Threshold during the monitoring periods of May and June 2018.

1.0 Introduction

The Rainy River Mine (RRM) is located approximately 65 kilometres (km) by road, northwest of Fort Frances, Ontario. Wood Environment & Infrastructure Solutions (Wood) was retained by New Gold Inc. (New Gold) to complete a sound monitoring study at two Eastern Whip-poor-will habitat receptor locations adjacent to the RRM site. The sound monitoring study is required by the Ministry of Natural Resources and Forestry (MNRF) *Endangered Species Act* (ESA) Overall Benefits Permit No. FF-C-001-14.

During the field program, the RRM was transitioning from the development phase to the operational phase. The main activities associated with the current operations at the time were aggregate extraction, material handling, vehicle movement, plant operations, crushing operations, open pit development and other mining fleet operations.

The MNRF ESA Permit requires monitoring of sound levels at two whip-poor-will habitat receptor areas near the RRM site at the beginning of May and June every year. The purpose of this sound monitoring study was to fulfill the requirements of the Permit, and confirm that the RRM sound levels are within the Sound Level Threshold of 50 dBA (A-weighted decibels), as defined in the Permit. This study was completed by Qualified Professionals as required by the Permit per Sections 3.1 and 4.1(g).

A glossary of commonly used sound terminology is provided in Appendix A of this report.

2.0 Project Description

The RRM includes an open pit, underground mine, a processing plant, and related facilities and infrastructure. Overburden and mine rock removed from the open pit are stored in adjacent stockpiles. Ore is processed at the onsite processing plant.

The project is currently in transition from the development phase to the operational phase. The aggregate pits will continue to operate during the transition phase and the underground mining operations are not expected to start during this period. The RRM crushing plants at the aggregate pits and other site activities were in operation during these sound monitoring periods. The monitoring period and collected sound data are representative of regular site activities required for the transition from the construction phase to the operational phase. .

3.0 Whip-poor-will Habitat Receptors

As defined in the ESA Permit, there are three whip-poor-will habitat receptor areas within the vicinity of the RRM site (Figure 1). There are two Eastern Locations which are located directly north and south of the RRM , and one Western Location, located west of the RRM. Sound monitoring is required at the two Eastern Receptor Locations as they are predicted to experience higher levels of sound than the Western Location, as specified in the ESA Permit.

4.0 Sound Monitoring

Automated sound measurements were conducted at the beginning of May and June 2018 (May 1-7 and June 1-7). Sound monitoring conformed to the technical requirements set out within the Ministry of the Environment (MOE) publications NPC-102 and NPC-103 (MOE 1977a,b). The measurement locations, instrumentation, weather conditions and results are discussed in the following sections.

4.1 Monitoring Locations

Two sound monitors (South Receptor Monitor – SRM, and North Receptor Monitor – NRM) were used for this sound monitoring program (Figure 1). UTM coordinates are provided in Table 1.

Table 1: Sound Monitoring Locations

Description of Monitor Location	Sound Monitor ID	UTM Coordinates [1]	
		Easting (m)	Northing (m)
North Receptor	NRM	424444	5414473
South Receptor	SRM	424444	5406426

Note

1. All coordinates are in the UTM coordinate system Zone 15T (NAD83).

Abbreviation(s)

m: metres

4.2 Instrumentation

Bruel & Kjaer 2250E Class 1 integrating sound level meters, were used for the sound level measurements. The monitors were set to automatically measure the A-weighted hourly energy equivalent sound level (L_{Aeq-1h}) and to continuously record audio.

Both sound level meters were factory calibrated within the preceding 24 months from the field program, and were field calibrated with a Bruel & Kjaer Type 4231 sound calibrator at the beginning and end of the monitoring periods. Calibration certificates for the monitors are provided in Appendix B. The microphones were fitted on vertical masts, approximately 1.5 m above the ground, and were provided with windscreens and bird-deterrent wires.

4.3 Meteorological Conditions

Monitored sound levels can be affected by meteorological conditions. To account for this influence, weather data was obtained from the RRM site weather station (Barron Site Station). The data from the station for the period of the investigation is presented in Appendix C.

For this sound monitoring study, and as defined in NPC-103 (MOE 1977b), inclement weather conditions are considered to have occurred under any of the following conditions:

- Humidity levels were above 90% or precipitation has occurred; and/or
- Wind speed was exceeded 20 km/hour; and/or
- Temperature was outside the operating range defined by the manufacturer of the sound level meter (i.e., below -10 °C or above +50 °C).

Inclement weather typically produces sound levels which are much higher than would otherwise be recorded absent such conditions. Therefore, sound data collected during inclement weather periods were not included in the assessment of measured sound levels against the Sound Level Threshold. However, all recorded sound level measurements, including periods of inclement weather conditions are reported in Appendix C for completeness of documentation.

4.4 Sound Monitoring Results

After the initial setup of the two sound monitors and verification of their functionality, the monitors were generally left unattended to record the sound levels. Each monitor was visited daily to download data and check on working condition.

The hourly L_{Aeq-1h} sound levels measured are provided in Appendix C. A summary of the hourly sound levels measured at both locations during these periods is provided in Table 2.

Table 2: Hourly Sound Level Results Summary

Monitor	Hourly Sound Levels (L_{Aeq-1h}, dBA)					
	May 2018			June 2018		
	Minimum	Average	Maximum	Minimum	Average	Maximum
North Monitor — NRM	27	39	52	26	42	51
South Monitor — SRM	25	36	56	30	41	52

Note

1. All coordinates are in the UTM coordinate system Zone 15T (NAD83).

For the purposes of this assessment, and as per the MOE NPC-103 guidelines for sound measurements, sound data collected during inclement weather was not included in the assessment against the 50 dBA criteria limit and were excluded from the results presented in Table 2. The complete hourly data is reported in Appendix C.

The hourly sound levels at NRM and SRM in 2018 were within the Sound Level Threshold of 50 dBA for 331 of 336 hours of data collected at the receptor locations. The measured hourly sound levels are graphically presented in Appendix D. A review of the audio files revealed that four of the five exceedances noted were a result of either wildlife activities or wind, and were not primarily caused by RRM activities.

The fifth exceedance which occurred at the NRM on May 3rd, 2018, during the hour of 21:00 was noteworthy. The measured L_{Aeq-1h} was 52 dBA, 2 dB over the Sound Level Threshold of 50 dBA. The audio file revealed both audible mine equipment noise, likely dozers, as well as wildlife noise. Throughout the hour, these two sources of sound often occurred simultaneously without either of them being subjectively louder than the other. As a result, it is inconclusive whether the RRM equipment, wildlife, or the combination of them caused the exceedance. Therefore, the RRM sound levels measured at the whip-poor-will receptor locations during the monitoring periods of May and June 2018 are believed to satisfy 50 dBA Sound Level Threshold identified in the Permit.

5.0 Conclusions

Sound monitoring at the two Eastern Whip-poor-will habitat receptor locations, as required by the ESA Overall Beneits Permit (No. FF-C-001-14) for the RRM, was completed at the beginning of May and June 2018. The sound measurements were conducted in accordance with the applicable MOE publications NPC-102 and NPC-103 (MOE 1977a,b).

The hourly sound levels were within the Sound Level Threshold of 50 dBA for the entire monitoring period, with the exception of 5 out of 336 hours of data collected at the receptor locations. A review of the audio files revealed that the exceedances were not primarily caused by the RRM activities. Therefore, based on the data collected the RRM sound levels measured at the whip-poor-will receptor locations are

believed to have been in compliance with the 50 dBA Sound Level Threshold during the monitoring periods of May and June 2018.

Glossary of Sound Terminology

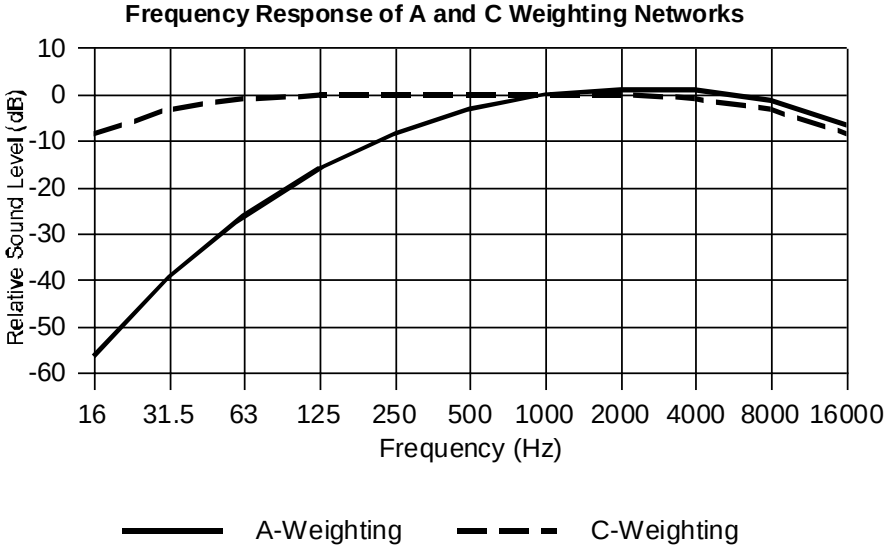
Glossary of Commonly Used Sound Terminology

Ambient or Background Noise: The ambient noise from all sources other than the sound of interest (i.e. sound other than that being measured). Under most MOE guidelines, aircraft overflights and train noise, due to their transient nature, are normally excluded from measurements of background noise.

Attenuation: The reduction of sound intensity by various means (e.g., air, humidity, porous materials, etc.).

dB - Decibel: The logarithmic units associated with sound pressure level, sound power level, or acceleration level. See sound pressure level, for example.

dBA - Decibel, A-Weighted: The logarithmic units associated with a sound pressure level, where the sound pressure signal has been filtered using a frequency weighting that mimics the response of the human ear to quiet sound levels. The resultant sound pressure level is therefore representative of the subjective response of the human ear. A-weighted sound pressure levels are denoted by the suffix 'A' (ie. dBA), and the term pressure is normally omitted from the description (i.e., sound level or noise level).



dBC - Decibel, C-Weighted: The logarithmic units associated with a sound pressure level, where the sound pressure signal has been filtered using a frequency weighting that mimics the response of the human ear to loud sound levels. C-weighted sound pressure levels are denoted by the suffix 'C' (ie. dBC). C-weighted levels are often used in low-frequency noise analysis, as the filtering effect is nearly flat at lower frequencies.

dBL or dBLin - Decibel, Linear: The logarithmic units associated with a sound pressure level, where the sound pressure signal is unfiltered, and represents the full spectrum of incoming noise.

Calibrator (Acoustical): A device which produces a known sound pressure on the microphone of a sound level measurement system, and is used to adjust the system to standard specifications.

Directivity Factor (Q) (also, **Directional** or **Directionality Factor):** A factor mathematically related to Directivity Index, used in calculating propagated sound levels to account for the effect of reflecting surfaces near to the source. For example, for a source in free space where the sound is radiating spherically, Q = 1. For a source located on or very near to a surface (such as the ground, a wall, rooftop, etc.), where the sound is radiating hemispherically, Q = 2. This accounts for the additional sound energy reflecting off the surface, and translates into a +3 dB add.

Energy Equivalent Sound Level (L_{eq}): An energy-average sound level taken over a specified period of time. It represents the average sound pressure encountered for the period. The time period is often added as a suffix to the label (e.g., $L_{eq}(24)$ for the 24-hour equivalent sound level). L_{eq} is usually A-weighted. An L_{eq} value expressed in dBA is a good, single value descriptor of the annoyance of noise.

Exceedance Noise Level (L_N): The noise level exceeded N% of the time. It is a statistical measure of the noise level. For highly varying sounds, the L_{90} represents the background noise level, L_{50} represents the median or typical noise level, and L_{10} represents the short term peak noise levels, such as those due to occasional traffic or a barking dog.

Far Field: Describes a region in free space where the sound pressure level from a source obeys the inverse-square law (the sound pressure level decreases 6 dB with each doubling of distance from the source). Also, in this region the sound particle velocity is in phase with the sound pressure. Closer to the source where these two conditions do not hold constitutes the "near field" region.

Free Sound Field (Free Field): A sound field in which the effects of obstacles or boundaries on sound propagated in that field are negligible.

Frequency: The number of times per second that the sine wave of sound or of a vibrating object repeats itself, now expressed in hertz (Hz), formerly in cycles per second (cps).

Hertz (Hz): Unit of measurement of frequency, numerically equal to cycles per second.

Human Perception of Sound: The human perception of noise impact is an important consideration in qualifying the noise effects caused by projects. The following table presents a general guideline.

Increase in Noise Level (dB)	Perception
3 or less	insignificant due to imperceptibility
4 to 5	just-noticeable difference
6 to 9	marginally significant
10 or more	significant, perceived as a doubling of sound exposure

Impact Sound: The sound produced by the collision of two solid objects, e.g., footsteps, dropped objects, etc., on an interior surface (wall, floor, or ceiling) of a building. Typical industrial sources include punch presses, forging hammers, etc.

Impulsive Noise: a) Single or multiple sound pressure peak(s) (with either a rise time less than 200 milliseconds or total duration less than 200 milliseconds) spaced at least by 500 millisecond pauses, b) A sharp sound pressure peak occurring in a short interval of time.

Infrasonic: Sounds of a frequency lower than 20 hertz.

Insertion Loss (IL): The arithmetic difference between the sound level from a source before and after the installation of a noise mitigation measure, at the same location. Insertion loss is typically presented as a positive number, i.e., the post-mitigation sound level is lower than the pre-mitigation level. Insertion loss is expressed in dB and is usually specified per 1/1 octave band, per 1/3 octave band, or overall.

Low Frequency Noise (LFN): Noise in the low frequency range, from infrasonic sounds (<20 Hz) up to 250 Hz.

Masking: a) The process by which the threshold of audibility for a sound is raised by the presence of another (masking) sound, or b) The amount by which the threshold of audibility of a sound is raised by the presence of another (masking) sound.

Near Field: The sound field very near to a source, where sound pressure does not obey the inverse-square law and the particle velocity is not in phase with the sound pressure.

Noise: Unwanted sound.

Noise Level: Same as Sound Level, except applied to unwanted sounds.

Peak Sound Pressure Level: Same as Sound Pressure Level except that peak (not peak-to-peak) sound pressure values are used in place of RMS pressures.

Quasi-Steady Impulsive Noise: Noise composed of a series of short, discrete events, characterized by rapid rise times, but with less than 0.5 seconds elapsing between events.

RMS Sound Pressure: The square-root of the mean-squared pressure of a sound (usually the result of an RMS detector on a microphone signal).

Reverberant Field: The region in a room where the reflected sound dominates, as opposed to the region close to the noise source where the direct sound dominates.

Sound: a dynamic (fluctuating) pressure.

Sound Exposure Level (SEL): An L_{eq} referenced to a one second duration. Also known as the Single Event Level. It is a measure of the cumulative noise exposure for a single event. It provides a measure of the accumulation of sound energy over the duration of the event.

Sound Intensity: The sound energy flow through a unit area in a unit time.

Sound Level Meter: An instrument comprised of a microphone, amplifier, output meter, and frequency-weighting networks which is used for the measurement of noise and sound levels.

Sound Pressure Level (SPL): The logarithmic ratio of the RMS sound pressure to the sound pressure at the threshold of hearing. The sound pressure level is defined by equation (1) where P is the RMS pressure due to a sound and P_0 is the reference pressure. P_0 is usually taken as 2.0×10^{-5} Pascals.

(1) $SPL\ (dB) = 20 \log(P_{RMS}/P_0)$

Sound Power Level (PWL): The logarithmic ratio of the instantaneous sound power (energy) of a noise source to that of an international standard reference power. The sound power level is defined by equation (2) where W is the sound power of the source in watts, and W_0 is the reference power of 10^{-12} watts.

(2) $PWL\ (dB) = 10 \log(W/W_0)$

Interrelationships between sound pressure level (SPL) and sound power level (PWL) depend on the location and type of source.

Spectrum: The description of a sound wave's resolution into its components of frequency and amplitude.

Speed (Velocity) of Sound in Air: 344 m/s (1128 ft/s) at 70°F (21°C) in air at sea level.

Threshold of Audibility (Threshold of Detectability): The minimum sound pressure level at which a person can hear a specified frequency of sound over a specified number of trials.

June 2018

Note:

[1] Represents periods with not enough reportable data for the hour.

[2] Minutes from the hour that was affected by human activity downloading data was excluded from the L_{Aeq-1h}.

Limitations (optional)

Limitations (optional)

1. The work performed in the preparation of this report and the conclusions presented are subject to the following:
    a. The Standard Terms and Conditions which form a part of our Professional Services Contract;
    b. The Scope of Services;
    c. Time and Budgetary limitations as described in our Contract; and
    d. The Limitations stated herein.
2. No other warranties or representations, either expressed or implied, are made as to the professional services provided under the terms of our Contract, or the conclusions presented.
3. The conclusions presented in this report were based, in part, on visual observations of the Site and attendant structures. Our conclusions cannot and are not extended to include those portions of the Site or structures, which are not reasonably available, in Wood's opinion, for direct observation.
4. The environmental conditions at the Site were assessed, within the limitations set out above, having due regard for applicable environmental regulations as of the date of the inspection. A review of compliance by past owners or occupants of the Site with any applicable local, provincial or federal bylaws, orders-in-council, legislative enactments and regulations was not performed.
5. The Site history research included obtaining information from third parties and employees or agents of the owner. No attempt has been made to verify the accuracy of any information provided, unless specifically noted in our report.
6. Where testing was performed, it was carried out in accordance with the terms of our contract providing for testing. Other substances, or different quantities of substances testing for, may be present on-site and may be revealed by different or other testing not provided for in our contract.
7. Because of the limitations referred to above, different environmental conditions from those stated in our report may exist. Should such different conditions be encountered, Wood must be notified in order that it may determine if modifications to the conclusions in the report are necessary.
8. The utilization of Wood's services during the implementation of any remedial measures will allow Wood to observe compliance with the conclusions and recommendations contained in the report. Wood's involvement will also allow for changes to be made as necessary to suit field conditions as they are encountered.
9. This report is for the sole use of the party to whom it is addressed unless expressly stated otherwise in the report or contract. Any use which any third party makes of the report, in whole or the part, or any reliance thereon or decisions made based on any information or conclusions in the report is the sole responsibility of such third party. Wood accepts no responsibility whatsoever for damages or loss of any nature or kind suffered by any such third party as a result of actions taken or not taken or decisions made in reliance on the report or anything set out therein.
10. This report is not to be given over to any third party for any purpose whatsoever without the written permission of Wood.
11. Provided that the report is still reliable, and less than 12 months old, Wood will issue a third-party reliance letter to parties that the client identifies in writing, upon payment of the then current fee for such letters. All third parties relying on Wood's report, by such reliance agree to be bound by our proposal and Wood's standard reliance letter. Wood's standard reliance letter indicates that in no event shall Wood be liable for any damages, howsoever arising, relating to third-party reliance on Wood's report. No reliance by any party is permitted without such agreement.

Appendix B

New Gold 2018 Species at Risk Observations

Date	Species	Provincial ESA Designation	Federal SARA Designation	Comments
01/17/2018	Bald Eagle	Special Concern	--	End of Loslo Rd feeding on a deer carcass
03/11/2018	Bald Eagle	Special Concern	--	Flying over West Gate
03/12/2018	Bald Eagle	Special Concern	--	2 near underground portal location, roosting in a tree
03/16/2018	Barn Owl	Endangered	Endangered	In a tree on Eliuk Rd
03/21/2018	Bald Eagle	Special Concern	--	Flying over West Creek Diversion
03/24/2018	Bald Eagle	Special Concern	--	Flying over south air quality station
03/26/2018	Bald Eagle	Special Concern	--	Flying over Loslo Creek
03/26/2018	Bald Eagle	Special Concern	--	Flying over West Creek Diversion
04/12/2018	Bald Eagle	Special Concern	--	Flying over Barrons site
04/16/2018	Bald Eagle	Special Concern	--	Flying over Tait quarry
04/16/2018	Bald Eagle	Special Concern	--	Flying over Mine Rock Pond
04/16/2018	Bald Eagle	Special Concern	--	Flying over Marr site
04/27/2018	Bald Eagle	Special Concern	--	Attacking a duck in the air over the Mine Rock Pond
05/07/2018	Bobolink	Threatened	Threatened	Calling on a power line near the Nielson house
05/09/2018	Bald Eagle	Special Concern	--	Roosting in a tree near the hydrometric station
05/09/2018	American White Pelican	Threatened	--	Flying over Mine Rock Pond
05/12/2018	Barn Swallow	Threatened	Threatened	Sitting on a power line on Gallenger road
05/12/2018	American White Pelican	Threatened	--	Hazed off of Cell 2 pond
05/19/2018	Bald Eagle	Special Concern	--	Flying above the Mill
05/22/2018	Snapping Turtle	Special Concern	Special Concern	Crossing Teeple road
05/25/2018	Bald Eagle	Special Concern	--	Flying over Mine Rock Pond
05/25/2018	Bobolink	Threatened	Threatened	Calling from perches around Westgate
05/26/2018	Bald Eagle	Special Concern	--	Flying over Korpi road
05/27/2018	American White Pelican	Threatened	--	Flying over batch plant
05/27/2018	Bobolink	Threatened	Threatened	Calling from a pole near Westgate
06/06/2018	Barn Swallow	Threatened	Threatened	4 flying around the Admin building
06/06/2018	Bobolink	Threatened	Threatened	Calling and flying at OB17
06/07/2018	Bobolink	Threatened	Threatened	Calling from a hydro pole by the West Gate
06/07/2018	Barn Swallow	Threatened	Threatened	6 sitting on a power line at the West Gate
06/09/2018	Barn Swallow	Threatened	Threatened	Flying around the West Gate
06/10/2018	Bobolink	Threatened	Threatened	Flying around the West Gate
06/15/2018	Bald Eagle	Special Concern	--	2 flying above West Creek Pond

06/22/2018	American White Pelican	Threatened	--	22 flying over Mine Rock Pond
06/22/2018	Bobolink	Threatened	Threatened	Flying at OB17
06/22/2018	Bald Eagle	Special Concern	--	Flying over Mine Rock Pond
06/22/2018	American White Pelican	Threatened	--	Flying over Mine Rock Pond
06/23/2018	American White Pelican	Threatened	--	9 flying over Mine Rock Pond
06/23/2018	Bald Eagle	Special Concern	--	Flying over Marr site
06/24/2018	Bald Eagle	Special Concern	--	Flying above West Creek Pond
06/24/2018	American White Pelican	Threatened	--	Flying over Mine Rock Pond
06/25/2018	Bald Eagle	Special Concern	--	Flying over Mine Rock Pond
06/25/2018	American White Pelican	Threatened	--	25 flying over Mine Rock Pond
06/29/2018	American White Pelican	Threatened	--	18 flying over Mine Rock Pond
07/04/2018	Bald Eagle	Special Concern	--	Flying around the Mine Rock Pond
07/07/2018	American White Pelican	Threatened	--	7 flying above Marr Site
07/07/2018	Barn Swallow	Threatened	Threatened	20 on a hydro line by the West Gate
07/08/2018	Bald Eagle	Special Concern	--	Flying above Korpi Road
07/08/2018	Bobolink	Threatened	Threatened	14 flying around the West Gate
07/13/2018	American White Pelican	Threatened	--	13 flying around the Mine Rock Pond
07/26/2018	Barn Swallow	Threatened	Threatened	3 flying around maintenance truck shop, one fledgling found dead
08/14/2018	Barn Swallow	Threatened	Threatened	20 roosting on the Fire Suppression Tank
08/16/2018	Barn Swallow	Threatened	Threatened	13 around West Gate
08/17/2018	American White Pelican	Threatened	--	14 flying over Mine Rock Pond
08/17/2018	Barn Swallow	Threatened	Threatened	50 around West Gate
09/02/2018	Barn Swallow	Threatened	Threatened	20 sitting on a wire by West Gate
09/04/2018	Bald Eagle	Special Concern	--	Flying over Cell 2
09/06/2018	Bald Eagle	Special Concern	--	Roosting in a tree by West Creek Pond
09/13/2018	Bald Eagle	Special Concern	--	Flying over Korpi Rd
09/14/2018	Bald Eagle	Special Concern	--	Flying over the Gate House
09/16/2018	Bald Eagle	Special Concern	--	Roosting in a tree by West Creek Pond
09/19/2018	Bald Eagle	Special Concern	--	2 roosting in a tree by West Creek Pond
09/20/2018	Bald Eagle	Special Concern	--	Flying over Teeple Rd
09/20/2018	Bald Eagle	Special Concern	--	Flying over Roen Rd
09/20/2018	Bald Eagle	Special Concern	--	2 flying over Mine Rock Pond

09/24/2018	Bald Eagle	Special Concern	--	Flying over Teeple Rd
09/25/2018	Bald Eagle	Special Concern	--	4 flying over Teeple Pond
09/29/2018	Bald Eagle	Special Concern	--	12 in OBA land 16 feeding on a deer carcass
10/05/2018	Golden Eagle	Endangered	--	Flying over Roen pit
10/13/2018	Bald Eagle	Special Concern	--	Flying over East Access Rd
10/25/2018	Bald Eagle	Special Concern	--	Flying over the batch plant
10/31/2018	Bald Eagle	Special Concern	--	Flying over West Gate
11/05/2018	Bald Eagle	Special Concern	--	Flying over Gallenger Rd
11/10/2018	Cougar	Endangered	--	Crossing Korpi Rd
11/14/2018	Bald Eagle	Special Concern	--	Flying over the Gallenger Rd
12/19/2018	Bald Eagle	Special Concern	--	Roosting in a tree over West Creek Pond.

Mr. Nigel Fisher, Environmental Superintendent
New Gold Inc.
Rainy River Project
317 Heatwole Road
Barwick, Ontario, Canada, P0W 1E0

Dear Mr. Fisher:

Re: Rainy River Project, Updated Acoustic Assessment Report for Early Operations

Amec Foster Wheeler Environment & Infrastructure, a Division of Amec Foster Wheeler Americas Limited, is pleased to provide the attached Updated Acoustic Assessment Report (AAR) for the Rainy River Project (RRP).

The original AAR was prepared in support of the Environmental Compliance Approval – Air and Noise and it addressed sound impacts from the development and operational phases. The current update addresses the RRP early operation phase which is a transitional phase from the development phase into operation. The current update also incorporates source sound data collected during our recent field measurements.

We greatly appreciate the opportunity to provide support for the Rainy River Project. Should you have any questions regarding the study, please do not hesitate to contact us.

Yours sincerely,
Amec Foster Wheeler Environment & Infrastructure
a Division of Amec Foster Wheeler Americas Limited

EXECUTIVE SUMMARY

The Rainy River Project (RPP) site is within the Township of Chapple, approximately 65 kilometres (km), by road, northwest of Fort Frances within northwestern Ontario. Amec Foster Wheeler Environment & Infrastructure (Amec Foster Wheeler) was retained by New Gold Inc. (New Gold) to update the Acoustic Assessment Report (AAR) to satisfy the conditions in the Environmental Compliance Approval (ECA) for the RRP site. The RRP currently operates under ECA No. 0412-A2LR4V, issued on September 24, 2015.

The original AAR [1] was prepared in support of the ECA application and it addressed sound impacts from the development and operational phases. The RRP is currently in transition from the development phase to the operational phase. During this transitional phase some of the development phase activities will overlap with operation phase activities. The current update only addresses sound impacts from the RRP transition phase (early operations) as this aspect was not assessed in the original AAR. This report provides a complete AAR for the early operation phase. The life of mine operations will be assessed separately prior to start of underground mining operations.

The current update excludes the receptors (Points of Reception 05, 13, 18 and 26) which have been acquired by New Gold since the original AAR was prepared. The current update also incorporates source sound data collected from the field measurements on September 2017.

The main activities associated with the early operation phase include aggregate extraction, material handling, vehicle movement, plant operations, crushing operations and other mining fleet operations. However, the underground portal has yet to be developed and underground mining is expected to start in 2019. Therefore, sound sources associated with the underground operations are excluded from the current assessment, they will only be included with the assessment for life of mine operations.

A blast impact assessment was previously completed for the site by Amec Foster Wheeler under a separate cover [2]. An update of the blast impact assessment is not required as there are no changes to the blast location or charge size.

The RRP site operates 24 hours per day, 7 days per week. Nineteen types of significant sound sources were identified at the RRP site and included in this assessment. The emergency generators (EG1 and EG2) and fire pumps are assessed separately as required by the guidelines for the testing purpose only.

Twenty-two representative Points of Reception were identified and considered for this assessment, including six accessible vacant lot receptors.

The applicable guideline for the RRP site is the Ministry of the Environment and Climate Change (MOECC) Environmental Noise Guideline NPC-300, ‘’Noise Assessment Criteria for Stationary Sources and for Land Use Planning.” The RRP site is located in a rural area which is best

described as a Class 3 area in accordance with the area classifications defined within Publication NPC-300.

Receptor sound impacts associated with the RRP early operations were assessed through predictive acoustic modelling. The MOECC exclusionary sound level limits were used for this assessment. Under the predictable worst-case sound emission scenario, the RRP site is predicted to operate in compliance with the applicable MOECC NPC-300 guideline for day-time, evening and night-time during early operation phase.

1.0 INTRODUCTION

Amec Foster Wheeler Environment & Infrastructure (Amec Foster Wheeler) was retained by New Gold Inc. (New Gold) to update the Acoustic Assessment Report (AAR) to support the Environmental Compliance Approval (ECA) for the Rainy River Project (RRP). The RRP currently operates under ECA No. 0412-A2LR4V, issued on September 24, 2015.

An AAR [1] was prepared by Amec Foster Wheeler in September 2014 in support of the ECA (Air and Noise) application, and it addressed sound impacts from development and operational phases. The RRP is currently in transition from the development phase to the operational phase. During this transitional phase some of the development phase activities will overlap with operational phase activities. The underground mining operations have not yet commenced but are expected to start in 2019. The current update only addresses sound impacts from the RRP transitional phase (early operations) as this aspect was not assessed in the original AAR. The life of mine operations will be assessed separately prior to start of underground mining operations.

The RRP site does not have any large sources of vibration other than blasting activity at the site. As such, this assessment focuses only on potential steady sound impacts from the RRP site. A blast impact assessment was previously completed for the site by Amec Foster Wheeler under a separate cover [2]. An update of the blast impact assessment is not required as there are no changes to the blast location or charge size.

The current update excludes the Points of Reception (PORs) 05, 13, 18 and 26 which have been acquired by New Gold since the original AAR was prepared. The current update also incorporates source sound data collected from the field measurements on September 2017. This report provides a complete AAR for the early operation and is intended to meet the Ministry of the Environment and Climate Change (MOECC) requirements outlined in References [3] and [4].

A completed copy of the Acoustic Assessment Report Checklist, as required by Reference [3], has been included in Appendix A.

An Emissions Summary and Dispersion Modelling Report (ESDM report) for the site was completed by Amec Foster Wheeler in support of the ECA application. Where possible, we have used the same source names and identification numbers in this AAR as those used within the ESDM report.

2.0 PROJECT DESCRIPTION

The RRP site is within the Township of Chapple, approximately 65 kilometres (km), by road, northwest of Fort Frances within northwestern Ontario. The maximum expected ore production during the operation phase is approximately 7,200 kilotonnes (kt) per year of ore and that includes both open pit and underground mining operations. In order to achieve the annual production rate, daily ore production rates may vary but is not expected to exceed 32 kt per day. The North American Industry Classification System (NAICS) code for the RRP site is 212220 described as “Gold and Silver Ore Mining.”

The RRP includes an open pit, underground mine, processing plant, and related facilities and infrastructure. Overburden and mine rock removed from the open pit are stored in stockpiles nearby. Ore is processed at the onsite processing plant. The RRP is currently in transition from development phase to operation. The current activities at the site include aggregate extraction, material handling, vehicle movement, plant operations, crushing operations and other mining fleet operations.

The area surrounding the RRP site is a rural area with an acoustical environment dominated by natural sounds having little or no road traffic. However, the receptors along Highway 600 experience high background sound levels during daytime from Highway 600 traffic.

The following figure and appendices provide information about the RRP site and points of reception location and surrounding land uses:

- Figure 1: Site Aerial Map with Points of Reception Location;
- Appendix B: Land-use Zoning Map of the Site and Surrounding Area; and
- Appendix C: Site Layout.

The RRP site operates 24 hours per day and 7 days per week.

3.0 SOUND SOURCE SUMMARY

There are 19 types of sound sources identified as significant (i.e., as emitting sound at a level where their cumulative impacts could be of concern) at the RRP site for the early operational phase. Where possible, the same source names and identification numbers as provided within the ESDM report have been used.

The significant sound sources identified are summarized below:

- 4 blast hole drills (2 Sandvik DR461i and 2 Sandvik DP1500i);
- 2 reverse circulation drills (Sandvik DR580);
- 6 diesel powered excavators (1 Komatsu PC8000, 2 Komatsu PC5500, 1 Komatsu PC3000, 1 Komatsu PC800LC and 1 Komatsu PC360LC);
- 15 track dozers (Komatsu D375, Komatsu D475, CAT D8, CAT D9, CAT D10 and CAT D11);
- 2 wheel loaders (Komatsu WA1200 and WA900);
- 1 wheel dozer (Komatsu KM WD600);
- 2 water trucks per hour on any haul routes (Komatsu CR20000);

- 1 motor grader per hour on any haul routes (CAT16H, 16M and 24M);
- 4 truck routes (Pit-PAG with 17 truck round trips/hour, Pit-NPAG/OB with 27 truck round trips/hour and Pit-stockpile with 6 truck round trips/hour) with Komatsu 830E trucks;
- 4 aggregate pits (LD4, Roen, Outcrop 3 and East Outcrop) each with portable a crusher, screener, loader, excavator and a truck route;
- 1 primary crusher;
- 2 dust collectors (primary and reclaim dust collectors);
- 1 wet scrubber (pebble crusher scrubber);
- 4 air compressors at Water Management Pond;
- 20 water pumps for dewatering operations in the pit and other areas;
- 1 power generator (CAT 660 kilowatts; kW) at Pinewood River pumphouse;
- 2 emergency generators (CAT 2,500 kW each) at the process plant;
- 2 fire pumps at the process plant; and
- 2 substation transformers at the process plant.

Sound emissions for many of the sources associated with the RRP were measured in the field by Amec Foster Wheeler (see Appendix D for measurements details). Where sound measurements were available the sound power levels were calculated from the measured levels. Sound levels for the generators, fire pumps and screeners were taken from manufacturer's datasheets. Komatsu 830E trucks with and without load were measured for the haul routes since the empty trucks were much quieter than the fully loaded trucks. Empty trucks were found to emit sound levels of approximately 11 decibel (dB) lower when compared with fully loaded trucks.

A summary of the significant sound sources is provided in Table 1, including sound power levels, sound characteristics, and any sound control measures. The locations of the sound sources considered in the assessment are shown in Figure 2.

The MOECC NPC-104 guideline prescribes adjustments for sources with special qualities or characters of sound. These are punitive adjustments which apply to sound sources with subjectively annoying characteristics, including tonal sounds, quasi-impulsive sounds, and beating sounds (sounds with cyclically varying amplitudes). Therefore, a tonal penalty of 5 dB was applied to the substation transformers, Komatsu D475 track dozers and Komatsu PC3000 excavator, as they exhibit tonal characteristics based on the mathematical qualification which is

outlined in Reference [5]. The measured equipment sound levels and sound calculations are provided in Appendix D.

All insignificant sound sources at the RRP site are listed in Appendix E.

Details of the RRP site sound sources are provided in the following table, figure and appendices:

- Table 1: Significant Sound Source Summary;
- Figure 2: Significant Sound Source Locations;
- Appendix D: Sound Measurement Details and Calculations; and
- Appendix E: List of Insignificant Sound Sources.

4.0 SOUND MITIGATION MEASURES SUMMARY

New Gold has taken a proactive approach to minimize sound impacts to neighbors and mitigation measures have been incorporated into the project from the onset of design. These measures are inherent to the current design of the RRP site and are reflected in the noise model predictions.

The sound pressure level of the emergency generators EG1 and EG2 is 80 A-weighted decibels (dBA) at 15 metres (m) and 74 dBA at 15 m for the power generator PG1 (660 kW).

As part of the sound mitigation, the following are considered for the RRP early operations:

- Aggregate pit operations are limited to daytime only (07:00 to 19:00), except for East Outcrop. Crushing operations at East Outcrop aggregate pit, and truck hauling/loading operations at all aggregate pits can be done 24 hours/day.

- The operation of the Komatsu D475 track dozers is limited to daytime only at the stockpiles (e.g., PAG, NPAG and ore stockpiles). Other track dozer models (e.g., Komatsu D375, CATD8, D9, or D10) can be used at those locations during evening and night-time periods (19:00 to 07:00).

- Emergency generators and fire pumps are expected to test during daytime only.

- Open pit bottom elevation is currently at 270 m which provides sufficient screening to the fleet equipment in the open pit.

The type of trucks used for the material handling and the number of round trips considered in the assessment are summarized in Appendix D.

5.0 POINT OF RECEPTION SUMMARY

Noise sensitive receptors of interest under NPC-300 guidelines include the following sound sensitive land uses:

- Permanent, seasonal, or rental residences;
- Hotels, motels and campgrounds;
- Schools, universities, libraries and daycare centres;
- Hospitals and clinics, nursing / retirement homes; and
- Churches and places of worship.

Three vacant lot receptors and one existing dwelling near Pinewood river (PORs 05, 13, 18 and 26) were acquired by New Gold since the original AAR was prepared. Therefore, these receptors have been removed from this assessment. A total of 22 representative (most-exposed) points of reception (PORs), including 6 accessible vacant lots, were identified and considered in this acoustic assessment. The existing dwellings identified in the area are two-storey houses.

The receptor location considered for the existing dwellings is given below:

- For the Plane of Window PORs, the receptor location is at 4.5 m above ground for a two-storey house (i.e., highest window level); and

- For the Outdoor PORs, the receptor location is at 1.5 m above ground within 30 m of a facade of a dwelling.

The receptor location for the vacant lots is chosen at 4.5 m height. The receptors presented for the existing dwellings in this report are the worst-impacted receptor location only. The PORs considered in the assessment are shown in Figure 1.

6.0 APPLICABLE SOUND GUIDELINES

The applicable guideline used for the RRP site is the MOECC Environmental Noise Guideline NPC-300, NPC-300 establishes four classes of acoustical environment to classify ambient background sound environment and establish class specific assessment sound level limits. The MOECC classifications, based on ambient background sound, are given below:

- Class 1 Area is used to describe an area with an acoustical environment typical of a major population centre, where the background sound level is dominated by the urban hum.

- Class 2 Area defines an area with an acoustical environment that has qualities representative of both Class 1 and Class 3 Areas. That means, absence of urban hum or a low ambient sound level is expected during early evening (i.e., between 19:00 and 23:00) than that in Class 1 Areas.

- Class 3 Area means a rural area with an acoustical environment dominated by natural sounds having little or no road traffic. Examples are small communities with populations of less than 1,000, agricultural areas, rural recreational areas, such as a cottage or a resort area, and wilderness areas.

- Class 4 Area is a newly classified area that would otherwise be defined as Class 1 (urban) or Class 2 (suburban). It has a relaxed criterion compared to any other Classes, is added for the new sound-sensitive developments in the industrial areas.

The area surrounding the RRP is best described as a Class 3 Area as per the guideline. NPC-300 states that non-impulsive (steady) one hour sound levels (L_{eq-1hr}) from stationary sound sources in Class 3 Areas shall not exceed that of the background, where the background (typically caused by natural sound sources) is considered to be:

- The higher of 45 dBA MOECC exclusionary sound level limit or background sound at both outdoor and plane of window receptor locations during day-time hours (07:00 to 19:00); and

- The higher of 40 dBA MOECC exclusionary sound level limit or background sound at both outdoor and plane of window receptor during the early evenings (19:00 to 23:00), and at the plane of window during night-time (23:00 to 07:00).

The guidelines also stipulate that the assessment consider the potential sound impact during a predictable worse case hour of operation, which is defined as a situation when the normally busy activity of the sources coincides with a low hourly background sound level. The MOECC's exclusionary sound limits were used for this assessment.

The non-emergency operation (i.e., testing and maintenance) of the emergency generators and fire pumps is assessed separately as required by the NPC-300 guidelines and a criterion of 50 dBA for Class 3 area is used for the assessment as they are tested during daytime hours only.

7.0 SOUND IMPACT ASSESSMENT

7.1 Methodology

The sound assessment for the RRP early operations was completed using a sound prediction software package (CadnaA), published by Datakustik GmbH and configured to implement the ISO 9613-2 environmental sound propagation algorithms. Off-site sound exposures due to the early operations were modelled. The CadnaA sound modelling software is widely accepted by the consulting industry and by the MOECC. All sound sources were assumed to operate simultaneously to model the predictable worst-case scenario.

In order to provide a better sound prediction at the receptor locations, due to sound emissions from a specific source(s), the modelling took into account the following factors:

- Source sound power level and directivity;
- Distance attenuation;
- Source-receptor geometry, including heights and elevations;
- Barrier effects of the building and surrounding topography;

- Ground and air (atmospheric) attenuation; and
- Foliage attenuation.

Komatsu 830E trucks with load and without are modelled separately for the haul routes since the sound levels measured for the empty trucks are about 11 dB lower than the fully loaded trucks. Water trucks and graders are modeled as line sources as they are moving along the haul routes within the site. For graders and track dozers, sound data for the loudest equipment model was used for this assessment to model the worst-case scenario without restricting operation of any of those equipment model to any particular area.

The predictable worst-case sound impact was modelled and assessed at the receptor locations. The RRP site operates 24 hours per day. However, the aggregate pits are expected to operate during daytime only, except loading and hauling. Therefore, the acoustic modelling has been completed for both daytime and night-time operations. The testing of emergency generators and fire pumps is assessed separately as required by the guidelines.

7.2 Modelling Results

The combined steady sound levels ($L_{eq\text{-}1hr}$) in dBA values for the predictable worst-case for the RRP early operations were calculated at the identified points of reception using sound emissions from the individual significant sources, as summarized in Table 1. The sound contours for the predictable worst-case operation are shown in Figures 3 through 5, and a point of reception impact summary is provided in Table 2 as required by the MOECC. The values provided in Table 2 represent individual contributions at the receptor locations from each of the sources identified in Table 1.

An acoustic assessment summary is provided in Table 3. Under the predicable worst-case sound emission scenario, the RRP early operations are predicted to be in compliance with the applicable MOECC NPC-300 guideline for day-time, evening and night-time operations. The sound levels at the receptors reported as part of this acoustic assessment represent the predictable worst-case operational impact. Key parameters included in the model and sample calculations are provided in Appendix F.

8.0 CONCLUSIONS

The AAR for the RRP early operations has been updated to address the changes during the RRP transition phase. Twenty-two PORs, including six accessible vacant lot receptors, are identified in the vicinity of the site and considered for this assessment. The existing PORs included in the assessment are 2-storey residential dwellings surrounding the site.

Receptor sound impact associated with the RRP early operations was assessed through predictive acoustic modelling. The MOECC exclusionary sound level limits were used as the criteria for the assessment. Under the predictable worst-case operational scenario, the RRP early operations sound levels at the receptor locations are expected to meet the applicable MOECC NPC-300 guideline limits for day-time, evening and night-time.

Therefore, the RRP early operations are expected to be in compliance with the applicable MOECC NPC-300 guideline sound level limits for day-time, evening and night-time.

10.0 CLOSING

This updated acoustic assessment report was prepared by Amec Foster Wheeler for the sole benefit of New Gold Inc. for specific application to the Rainy River Project. The quality of information, conclusions and estimates contained herein are consistent with the level of effort involved in Amec Foster Wheeler's services and based on: i) information available at the time of preparation, ii) data supplied by outside sources and iii) the assumptions, conditions and qualifications set forth in this document.

This report is intended to be used by New Gold only, and its nominated representatives, subject to the terms and conditions of its contract with Amec Foster Wheeler. Any other use of, or reliance

on, this report by any third party is at that party's sole risk. This report has been prepared in accordance with generally accepted industry-standard. No other warranty, expressed or implied, is made.

If you require further information regarding the above or the project in general, please contact the undersigned at (905) 568-2929. Thank you for the opportunity to be of service to New Gold Inc.

Yours truly,
Amec Foster Wheeler Environment & Infrastructure
a Division of Amec Foster Wheeler Americas Limited

Notes: 1. Source Location: O = Outside of building, including the roof, I = Inside of building

2. Sound Characteristic, per NPC-104

S = Steady; I = Impulsive; T = Tonal
Q = Quasi-Steady Impulsive; B = Buzzing; C = Cyclic

3. Noise Control Measures To Be Included

S = Silencer/Muffler; L = Lagging; O = other
A = Acoustic lining, plenum; E = acoustic enclosure; U = uncontrolled
B = Barrier

4 Sound power levels include 5 dB tonal penality for the sources with tonal characteristics.

Notes :

1 Daytime occurs from 0700-1900h. Evening occurs from 1900h to 2300h. Night-time occurs from 2300-0700h
2 Worst-case cumulative sound level from all applicable sources operating.
3 Has an acoustic audit (as defined in Publication NPC-233) been conducted with source in place and operating?
4 Applicable worst-case NPC-300 sound level limit.
5 Performance limit (aka guideline limit) based on following:
C = Calculated based on road traffic volumes in compliance with NPC-206 requirements.
M = Measured based on monitoring for a minimum 48 hour period, in accordance with NPC-233 requirements.
D = Default guideline minima per NCP300, as applicable (e.g., 45 dBA daytime limit for Class 3 Areas)

ACOUSTIC ASSESSMENT REPORT CHECK-LIST

Ministry of the Environment | Ministère de l'Environnement

Ontario

ACOUSTIC ASSESSMENT REPORT CHECK-LIST

Company Name: New Gold Inc.

Company Address: 1111 Victoria Ave. East

Thunder Bay, Ontario, P7C 1B7

Location of Facility: Rainy River Project

Township of Chapple, Ontario

The attached Acoustic Assessment Report was prepared in accordance with the guidance in the ministry document "Information to be Submitted for Approval of Stationary Sources of Sound" (NPC 233) dated October 1995 and the minimum required information identified in the check-list on the reverse of this sheet has been submitted.

Company Contact: New Gold Inc.

Name: _____

Title: _____

Phone Number: _____

Signature: _____

Date: _____

Technical Contact: Amec Foster Wheeler

Name: Mohammed Salim, P.Eng.

Representing: New Gold Inc.

Phone Number: (905) 568 2929 Extn. 4212

Signature: <Original signed by>

Date: October 20, 2017

ACOUSTIC ASSESSMENT REPORT CHECKLIST

	Required Information			
			Submitted	Explanation/Reference
1.0	**Introduction** (Project Background and Overview)		☑ Yes	Section 1
2.0	**Facility Description**			
	2.1	Operating hours of facility and significant Noise Sources	☑ Yes	Section 2 & Section 3
	2.2	Site Plan identifying all significant Noise Sources	☑ Yes	Figure 2
3.0	**Noise Source Summary**			
	3.1	***Noise Source Summary Table***	☑ Yes	Table 1
	3.2	Source noise emissions specifications	☑ Yes	Section 3
	3.3	Source Power/capacity ratings	☑ Yes	Appendix D
	3.4	Noise control equipment description and acoustical specifications	☑ Yes	Section 4
4.0	**Point of Reception Noise Impact Calculations**			
	4.1	***Point of Reception Noise Impact Table***	☑ Yes	Table 2
	4.2	Point(s) of Reception (POR) list and description	☑ Yes	Section 5
	4.3	Land-use Zoning Plan	☑ Yes	Appendix B
	4.4	Scaled Area Location Plan	☑ Yes	Figure 1
	4.5	Procedure used to assess noise impacts at each POR	☑ Yes	Section 7
	4.6	List of parameters/assumptions used in calculations	☑ Yes	Section 7/Appendix F
5.0	**Acoustic Assessment Summary**			
	5.1	***Acoustic Assessment Summary Table***	☑ Yes	Table 3
	5.2	Rationale for selecting applicable noise guideline limits	☑ Yes	Section 6
	5.3	Predictable Worst Case Impacts Operating Scenario	☑ Yes	Section 7
6.0	**Conclusions**			
	6.1	Statement of compliance with the selected noise performance limits	☑ Yes	Section 8
7.0	**Appendices** (Provide details such as)			
		Listing of Insignificant Noise Sources	☑ Yes	Appendix E
		Manufacture's Noise Specifications	☐ Yes	N/A
		Calculations	☑ Yes	Appendix D
		Instrumentation	☑ Yes	Appendix D
		Meteorology during Sound level Measurements	☑ Yes	Appendix D
		Raw Data from Measurements	☑ Yes	Appendix D
		Drawings (Facility/Equipment)	☑ Yes	Appendix C

Notes:

1. All measurements conducted on September 26-28, 2017, using Larson Davis 831 SLM.
2. All measurements were consistent with the applicable portions of the MOECC Publication NPC-103.
3. Calc Type of C, A, or S refer to the source geometry, and represent Cylindrical, Area, or Spherical sources, respectively.
4. SPL Ref Distance refers to the radial distance from the microphone to the acoustic centre of a spherical source or the symmetrical axis of a cylindrical source.
5. Net surface area refers to surface area corrected for partition coefficient. Partition coefficient applies only to spherical and cylindrical geometries. Sound power level is estimated using an area correction 10 log A.
6. Refer to "Spectral Weighting" column for dB or dBA application information.

Sound Level Measurement Instrumentation

Equipment sound level measurements at the RRP site were conducted by Amec Foster Wheeler on September 27 through 29, 2017. A Larson Davis Sound Track 831 Type I sound level meter equipped with a windscreen was used for the measurement. The Model 831 uses a Larson Davis Model PRML831 preamplifier and a PCB Electronics Model 377B02 precision microphone, which have been factory calibrated with the SLM unit. The SLM meets IEC 61672-1 Type 1 requirements. The sound level meter was field calibrated with a Larson-Davis Model CA200 precision acoustic calibrator before and after the measurements.

All measurements were conducted in accordance with MOECC NPC-103 measurement protocols. The sound level meter was programmed to record 1-second L_{eq}, L_{min} and L_{max}.

Vehicle Trips and Speed

Description	Route ID	Vehicle Type	Number of Trips/hr	Speed (km/h)

APPENDIX E

INSIGNIFICANT SOUND SOURCES

Summary of Insignificant Noise Sources

Project: Norbord Inc.
Location: Barwick, ON

Source ID	Source Description	Reason/Rational
DC3	Furnace Dust Collector	Small unit - no significant noise source
DC4	Lime Bin Dust Collector	Small unit - no significant noise source
DC5	Flocculant Handling Cartridge Filter	Small unit - no significant noise source
DC6	Copper Sulphate Loading & Mixing	Small unit - no significant noise source
DC7	Sodium Metabisulphate Loading	Small unit - no significant noise source
EF2	Cyanide Tank Exhaust	Small unit - no significant noise source
EF3	Dilute Acid Tank	Small unit - no significant noise source
VENT3	Hydrochloric Acid Tank	Not a noise source
LEACH	Leach Tanks	Not a noise source
HCND1	CN Destruction Tank	Not a noise source
HCND2	CN Destruction Tank	Not a noise source
Various	Space Heating in Buildings	Not noise sources

APPENDIX F

KEY PARAMETERS INCLUDED IN THE MODEL AND SAMPLE CALCULATIONS

Key Parameters Included in the Noise Model

Project: RRP
Location: Township of Chapple ON

Parameter	Value	Rationale
Ground Absorption	0.7	Accounts mostly soft surface between facility and receptors of interest.
Temperature	10°C	Ontario standard conditions
Relative Humidity	70%	Ontario standard conditions
Max. Order of Reflection	1	To account reflections from buildings and structures.
Reflection Coefficient	N/A	Accounts for absorption/attenuation from building surfaces

Receiver
Name: House 14 - South
ID: POR14
X: 427450.26

Dear Ms. St. Jean:

Re: Rainy River Mine
Ambient Air Quality Monitoring Program
First Quarter 2018 Report

Wood Environment & Infrastructure Solutions, a Division of Wood Canada Limited (hereinafter referred to as Wood), is a leading environment and infrastructure, engineering, consulting and project management organization. Our team of professionals provides a full range of services to clients in a wide range of sectors including government, industrial & commercial, water, transportation, minerals & metals, oil & gas clients and clean energy. Environment and Infrastructure's core competencies are in environmental assessments, health and environmental risk assessment, environmental geology (site investigation), remediation engineering, geotechnical engineering and testing, and water resource services.

Wood is pleased to submit to New Gold Inc. (New Gold) the attached summary report of the results for the ambient air quality monitoring program for the first quarter of 2018 at the Rainy River Mine. The monitoring program consists of two air quality monitoring stations that were established in May 2015: one to the south of the Site near the beginning of the Highway 600 reroute on Tait Road, and one to the east of the Site on Gallinger Road. The sampling stations are operated and maintained by New Gold staff; Wood staff performed quarterly calibrations, provided technical guidance to New Gold field staff, communicated with the laboratory staff as required, and prepared the data summary report.

Wood will supply the MOECC with raw and edited data per the Operations Manual for Air Quality Monitoring in Ontario (MOECC 2016b).

The key finding(s) of the Q1 2018 monitoring are as follows:

- There was a measured exceedance of the TSP and iron Ambient Air Quality Criteria (AAQC) at the Gallinger Station in Q1 2018; and
- There were no exceedances of the dustfall or metals/metalloids (excluding iron) AAQC, PM2.5 Canadian Ambient Air Quality Standard, or SO_2/NO_2 criteria measured in Q1 2018.

The measured TSP and $PM_{2.5}$ concentrations for the Q1 2018 are depicted in Figures CL-1 and CL-2.

'Wood' is a trading name for John Wood Group PLC and its subsidiaries

Should you have any questions or wish to discuss the air monitoring program, please do not hesitate to contact the undersigned.

Sincerely,
Wood Environment & Infrastructure Solutions
a Division of Wood Canada Limited

1.0 INTRODUCTION

Wood is pleased to provide a summary of the First Quarter (Q1) 2018 results for the ambient air quality monitoring program undertaken at the Rainy River Mine located in northwestern Ontario. Two sampling stations were established in May 2015: one to the south of the Site near the beginning of the Highway 600 realignment at Tait Road, and one to the east of the Site on Gallinger Road (Figures 2-1, 2-2 and 2-3).

New Gold Inc. (New Gold) staff operate and maintain the sampling stations. Wood staff performed quarterly calibrations, provided technical guidance to New Gold field staff, communicated with the laboratory staff as required, and prepared the data summary reports.

This Quarterly Ambient Air Quality Report addresses the required elements of a Quarterly Report defined in the *Operations Manual for Air Quality Monitoring in Ontario* (MOECC 2016b), hereafter referred to as the Operations Manual. Specifically, the following information is provided:

- Summary statistics;
- Sampling dates (start and end where applicable); and
- A summary of exceedances of an Ontario Standard, Ambient Air Quality Criterion (AAQC), or Canadian Ambient Air Quality Standard (CAAQS).

The purpose of the air monitoring program is to quantify potential air quality effects associated with activities related to the Mine. The monitoring program consists of:

- Two High Volume (Hi-Vol) samplers for discrete sampling of Total Suspended Particulate (TSP) and metals;
- Two PQ200 samplers for discrete sampling of respirable particulate matter ($PM_{2.5}$);
- Two standard passive dustfall collection units;
- Two passive sampling enclosures each measuring NO_2 and SO_2; and
- One meteorological station to obtain real-time site wind speed, wind direction, temperature, relative humidity, and precipitation.

2.0 MONITORING STATIONS

The ambient monitoring stations were sited in accordance with the criteria stipulated in the MOECC Operations Manual (MOECC 2018).

The general location for the two stations is shown in Figure 2-1. UTM co-ordinates for each station based upon NAD 83, are presented in Table 2-1. Photographs showing each station and the equipment installed are presented as Figures 2-2 and 2-3.

There were no changes to the stations or station locations in Q1 2018.

3.0 ANALYTICAL AND MONITORING METHODS

3.1 TSP and Metals

The TSP concentrations were determined using the standard gravimetric reference methods approved by the United States Environmental Protection Agency (US EPA) and the Ontario Ministry of the Environment and Climate Change (MOECC); as described in the Operations Manual (MOECC 2016b). Measurements of 24-hour average TSP and metal concentrations were collected as specified in the Operations Manual (MOECC 2016b); particulate samples were collected every sixth day as per the North American schedule (US EPA 2017). Sampling was performed with Hi-Vol samplers (brush motor and mass flow controlled). Metals and metalloids analyzed included the following: arsenic (As), cadmium (Cd), chromium (Cr), cobalt (Co), copper (Cu), iron (Fe), lead (Pb), manganese (Mn), nickel (Ni), selenium (Se), vanadium (V) and zinc (Zn). A metalloid is an element such as As that has both metallic and non-metallic properties.

The lowest detectable limit of total particulate on the filter is 2.3 milligrams (mg). A typical 24-hour sample volume of 1,630 m^3 results in a method detection limit of 1.4 micrograms per cubic metre ($\mu g/m^3$).

Metal concentrations were determined using standard Inductively Coupled Plasma Atomic Emission Spectroscopy (ICP/AES) methodology. Method detection limits are as shown on the data sheets in Appendix A-1.

3.2 $PM_{2.5}$

Sampling was performed with PQ200 samplers. $PM_{2.5}$ concentrations were determined using the standard gravimetric reference methods approved by the US EPA and the MOECC; as described in the Operations Manual (MOECC 2016b). $PM_{2.5}$ measurements were collected over a 24-hour period to match the averaging time for the Canadian Ambient Air Quality Standard (CAAQS); particulate samples were collected every sixth day as per the North American schedule (US EPA 2017).

The lowest detectable limit of $PM_{2.5}$ on the Teflon filters is 1 µg. A typical 24-hour sample volume of 24 m^3 results in a method detection limit of 0.04 $\mu g/m^3$.

3.3 Total Dustfall

Water soluble and insoluble portions of dustfall were determined using ASTM method D-1739-98 and the British Columbia Ministry of Environment method outlined in Section G of Air Constituents – Inorganic (MOECC 2016c). Standard dustfall samplers were used to measure total dustfall deposition. The method detection limit for total dustfall is 0.3 g/m^2/30 days. Bird deterrents were added in Q3 2017 with the goal of reducing contamination.

3.4 Passive Sampling for SO_2 and NO_2

SO_2 and NO_2 concentrations were monitored with passive sampling devices. The exposed permeation filters were analyzed by the Maxxam Analytics Inc. laboratory (Edmonton, Alberta). Testing was performed using methodology developed, approved and validated by Alberta Environment with the support of the Alberta Research Council, the Clean Air Strategic Alliance of Alberta, and the National Research Council of Canada.

Sample uptake is dependent on temperature, relative humidity and wind speed. Analytical results are adjusted for these meteorological parameters measured during the exposure period (monthly averages). Required meteorological data were obtained from the Environment and Climate Change Canada website. Fort Frances meteorological station (Climate ID 6022474) is downloaded by Maxxam Analytics with each sample submission. For both SO_2 and NO_2, the analytical method detection limit is in the order of 0.1 parts per billion (ppb). Validation tests conducted in Alberta show that results from passive sampling are typically within 10% of those obtained from sampling with continuous analyzers for 30-day exposure periods.

Since there are no MOECC guidelines for monthly concentrations of SO_2 and NO_2 obtained from passive sampling, the data is only used for screening purposes. For NO_2, the monthly results were compared to the MOECC 24-hour AAQC converted to an equivalent 30-day average (78 µg/m^3) using the methodology outlined in the *Procedure for Preparing an Emission Summary and Dispersion Modelling Report* (MOECC 2017). For SO_2, the results were compared against the 30-day Alberta Ambient Air Quality Objective of 30 µg/m^3 (AEP 2016).

3.5 Field Operations

3.5.1 Hi-Vol Samplers

To meet the requirements of 1 in 6 day sampling schedule, stations were visited once every six days. The exposed filter was recovered and a pre-weighed filter installed for the subsequent sample run. Additional visits were made to resolve instrumentation issues and perform flow calibration checks and preventative maintenance.

Wood staff performed flow, temperature, and barometric pressure calibrations using an electronic BGI flow calibrator. The flows were calibrated to 16.7 litres per minute (LPM) for each station. Q1 Calibrations were performed on:

- November 2, 2017 – All hi-vols calibrated; and
- February 21, 2018 – All hi-vols calibrated.

3.5.2 PQ200 Samplers

To meet the requirements of 1 in 6 day sampling schedule, stations were visited once every six days. The exposed filter was recovered and a pre-weighed filter installed for the subsequent sample run. Additional visits were made to resolve instrumentation issues and perform flow calibration checks and preventative maintenance.

Wood staff performed flow, temperature, and barometric pressure calibrations using an electronic BGI flow calibrator. The flows were calibrated to 16.7 litres per minute (LPM) for each station. Q1 Calibrations were performed on:

- November 2, 2017 – All PQ200s calibrated; and
- February 21, 2018 – All PQ200s calibrated.

3.5.3 Dustfall Samplers

The dustfall samplers containing algaecide were changed every month, as required. Dustfall jars were provided by the laboratory with screw-on lids to prevent sample loss during transport.

3.5.4 Passive Samplers

The permeation filters in the passive samplers were changed every month, as required. Permeation filters were kept in filter cassettes inside Ziploc bags until deployed to prevent premature exposure. After the sample was collected, the filter was placed back in its cassette and into a Ziploc bag for shipment to the lab.

3.5.5 Performance and Site Audits

There were no MOECC audits conducted in Q1 2018.

3.5.6 Equipment and Sampling Issues

During Q1 2018, the ambient air monitoring program was successful in collecting sufficient valid data to fulfil the requirements of the MOECC Operations Manual. A number of invalid samples were collected and are discussed below:

- The sampling schedule for both stations was offset by one day for a period in Q1 due to a scheduling error however this is inconsequential to the validity of the results; and
- February 2: $PM_{2.5}$ sample at the Tait Road station was invalid due to too much sample volume collected.

4.0 RESULTS

Sampling program results for Q1 2018 are presented in Appendix A-1 for the particulate and metals data, Appendix A-2 for the dustfall data and Appendix A-3 for the passive SO_2 and NO_2 data. For the purpose of performing statistical analyses following MOECC protocol, a value of half the detection limit was substituted for concentrations less than the detection limit.

For comparative purposes, the MOECC AAQC and CAAQS values are presented, where available, noting that the AAQCs are numerically equivalent to the Ontario Regulation 419/05 standards.

Summaries of the statistical analyses for Q1 2018 for the TSP, metals, and $PM_{2.5}$ concentrations are presented in Tables 4-1, 4-2, and 4-3, respectively. During the quarter, the 1 in 6-day sampling schedule presented a possible 15 sampling days between January 1 and March 31, 2018.

A summary of the statistical analyses for Q1 2018 for the total dustfall data is presented in Table 4-4.

A summary of the statistical analysis for the Q1 2018 passive SO_2 and NO_2 results is presented in Table 4-5.

4.1 TSP and Metals

The Gallinger Road and Tait Road stations both collected 15 valid samples, respectively, resulting in 100% valid data for Q1 2018.

For the quarter, the geometric mean TSP concentrations were 14.3 µg/m^3 for the Tait Road station and 27.1 µg/m^3 for the Gallinger Road station. Values reported by the laboratory as below the detection limit were, by convention, substituted with one-half of the detection limit. The maximum 24-hour concentration for TSP was 106.3 µg/m^3 at the Tait Road station (January 15, 2018), and 275.9 µg/m^3 at the Gallinger Road station (March 16, 2018).

The only exceedances of an MOECC AAQC measured for any of TSP, metals, or metalloids in Q1 2018 was at the Gallinger Road Station on March 16, 2018 where a TSP concentration of 275.9 µg/m^3 (230% of AAQC) and Fe concentration of 5.49 µg/m^3 (137% of AAQC) were measured.

The rolling 30-day average lead concentrations at both stations were at maximum 4% of the 30-day lead AAQC (0.2 µg/m^3) in Q1 2018.

Appendix A-1 and Figure 4-1 present individual sample data. The Q1 2018 TSP and metals summary statistics are summarized in Tables 4-1 and 4-2, respectively.

4.2 $PM_{2.5}$

The Gallinger Road and Tait Road stations both collected 15 and 14 valid samples, respectively, resulting in 93% and 100% valid data, respectively for Q1 2018. The February 2, 2018 sample at the Tait Road Station collected more than 110% of the required sample volume due to operator error and was invalidated.

Values reported by the laboratory as below the detection limit were, by convention, substituted with one-half of the detection limit. The maximum 24-hour concentration for $PM_{2.5}$ was 6.49 µg/m^3 at the Tait Road station (February 14, 2018), and 7.75 µg/m^3 at the Gallinger Road station (January 21, 2018).

There were no $PM_{2.5}$ exceedances of the AAQC of 30 µg/m^3 or CAAQS (ECCC 2013) of 28 µg/m^3 measured in Q1 2018. Appendix A-1 and Figure 4-2 present individual sample data.

The Q1 2018 $PM_{2.5}$ summary statistics are summarized in Table 4-3.

4.3 Total Dustfall

In Q1 2018, three valid samples were collected at each station. Each dustfall jar was exposed for approximately 30-days to coincide with each calendar month in the quarter.

There were no dustfall exceedances of the 30-day AAQC of 7 g/m^2 measured in Q1 2018

A summary of the results is presented in Table 4-4 and the monthly results are presented in Appendix A-2.

4.4 Passive SO_2 and NO_2

In Q1 2018, 3 valid samples were collected at each station for each of SO_2 and NO_2.

There are no MOECC standards, guidelines or AAQCs for SO_2 or NO_2 for a 30-day averaging period. The 30-day measured average SO_2 or NO_2 concentrations allow for future analysis of trends in the ambient concentrations, to identify any notable increases, and for potential comparison with dispersion modelling results.

For NO_2, the monthly results were compared to the MOECC 24-hour AAQC converted to an equivalent 30-day average (78 µg/m^3) using the methodology outlined in the *Procedure for Preparing an Emission Summary and Dispersion Modelling Report* (MOECC 2017). For SO_2, the results were compared against the Alberta Ambient Air Quality Objective of 30 µg/m^3 (AEP 2017).

A summary of the passive results is presented in Table 4-5 and the monthly results are presented in Appendix A-3.

4.5 Evaluation of Effects of Abatement Measures on Monitored Concentrations

The Rainy River Mine has a comprehensive Best Management Practices Plan (BMPP) for Fugitive Dust approved by the MOECC as part of the ECA review process. This BMPP effectively controls the generation and dispersion of dust such that the particulate matter measured at the two ambient monitoring stations was below the AAQC for all Q1 2018 samples, with the exception of one TSP measurement and the Gallinger Road Station.

Table 4-1: Summary Statistics for Q1 2018 TSP Concentration Data

Statistics	Tait Road (SW)	Gallinger Road (NE)
Geometric Mean (µg/m^3)	14.3	27.1
Arithmetic Mean (µg/m^3)	20.9	49.2
January Maximum (µg/m^3)	106.3	43.2
February Maximum (µg/m^3)	28.6	76.4
March Maximum (µg/m^3)	38.0	275.9
Maximum 24-hr (µg/m^3)	106.3 (Jan.15)	275.9 (Mar.16)
90th percentile	34.2	91.6
95th percentile	58.5	153.9
24-hr AAQC	120	120
No. of valid samples	15	15
Valid data	100%	100%
No. samples > AAQC (particulate)	0	1
No. samples > AAQC (metals)	0	1
No. samples > AAQC (metalloids)	0	0

Table 4-2: Summary Statistics for Q1 2018 Metals Concentration Data

Metal	24-hr AAQC (µg/m^3)	Tait Road (SW)		Gallinger Road (NE)	
		Maximum 24-hr Concentration (µg/m^3)	% 24-hr AAQC	Maximum 24-hr Concentration (µg/m^3)	% 24-hr AAQC

5.0 CONCLUSIONS

This report summarizes the data collected in Q1 2018 for the ambient air quality monitoring program at the Rainy River Mine.

The monitoring program collects TSP, metals, $PM_{2.5}$, total dustfall, NO_2, and SO_2 ambient air quality data from two monitoring stations, that were installed and commissioned in May 2015.

A summary of the Q1 2018 ambient air quality monitoring program results is provided below:

- There were 15 valid TSP samples collected at both stations resulting in 100% sample validity. Metal and metalloid concentrations were measured on each of the TSP filters.
- The only measured exceedances of an MOECC AAQC for TSP, metals, or metalloids in Q1 2018 was at the Gallinger Road Station. On March 16, 2018 a TSP concentration of 275.9 µg/m^3 (230% of AAQC) and a Fe concentration of 5.49 µg/m^3 (137% of AAQC) were measured.
- There were 14 and 15 valid PM2.5 samples collected at the Tait and Gallinger Road stations, respectively (93% and 100% valid data, respectively). There were no exceedances of the 24-hour $PM_{2.5}$ CAAQS in Q1 2018.
- There were 3 valid dustfall samples collected at each station (100% sample validity). There were no exceedances of the 30-day dustfall AAQC in Q1 2018.
- There were 3 valid passive SO_2 and NO_2 samples collected at each of the two stations (100% sample validity). There were no exceedances of AEP Criterion for SO_2 or the 30-day equivalent AAQC for NO_2 in Q1 2018.

7.0 CLOSING

This *Rainy River Mine Ambient Air Quality Monitoring Program First Quarter 2018 Report* was prepared by Wood for the sole benefit of New Gold Inc. for specific application to the Rainy River Mine. The quality of information, conclusions and estimates contained herein are consistent with the level of effort involved in Wood's services and based on:

i) information available at the time of preparation;

ii) data supplied by outside sources; and

iii) the assumptions, conditions and qualifications set forth in this document.

This report is intended to be used by New Gold only, and its nominated representatives, subject to the terms and conditions of its contract with Wood. Any other use of, or reliance on, this report by any third party is at that party's sole risk. This report has been prepared in accordance with generally accepted industry-standard practices. No other warranty, expressed or implied, is made.

If you require further information regarding the above or the Mine in general, please contact the undersigned at (905) 568-2929. Thank you for the opportunity to be of service to New Gold Inc.

Yours truly,
Wood Environment & Infrastructure Solutions
a Division of Wood Canada Limited

Dear Ms. St. Jean:

Re: Rainy River Mine
Ambient Air Quality Monitoring Program
Second Quarter 2018 Report

Wood Environment & Infrastructure Solutions, a Division of Wood Canada Limited (hereinafter referred to as Wood), is a leading environment and infrastructure, engineering, consulting and project management organization. Our team of professionals provides a full range of services to clients in a wide range of sectors including government, industrial & commercial, water, transportation, minerals & metals, oil & gas clients and clean energy. Environment and Infrastructure's core competencies are in environmental assessments, health and environmental risk assessment, environmental geology (site investigation), remediation engineering, geotechnical engineering and testing, and water resource services.

Wood is pleased to submit to New Gold Inc. (New Gold) the attached summary report of the results for the ambient air quality monitoring program for the second quarter of 2018 at the Rainy River Mine. The monitoring program consists of two air quality monitoring stations that were established in May 2015: one to the south of the Site near the beginning of the Highway 600 reroute on Tait Road, and one to the east of the Site on Gallinger Road. The sampling stations are operated and maintained by New Gold staff; Wood staff performed quarterly calibrations, provided technical guidance to New Gold field staff, communicated with the laboratory staff as required, and prepared the data summary report.

Wood will supply the MECP with raw and edited data per the Operations Manual for Air Quality Monitoring in Ontario (MECP 2016b).

The key finding(s) of the Q2 2018 monitoring are as follows:

- There was a measured exceedance of the TSP and iron Ambient Air Quality Criteria (AAQC) at the Gallinger Station in Q2 2018 on April 8. Winds on this day were light and variable; and
- There were no exceedances of the dustfall or metals/metalloids (excluding iron) AAQC, $PM_{2.5}$ Canadian Ambient Air Quality Standard, or SO_2/NO_2 criteria measured in Q2 2018.

The measured TSP and $PM_{2.5}$ concentrations for the Q2 2018 are depicted in Figures CL-1 and CL-2.

'Wood' is a trading name for John Wood Group PLC and its subsidiaries

Note that quarterly reports do not include interpretation of the data (i.e. exceedances); interpretation of results is included in the annual reporting. Should you have any questions or wish to discuss the air monitoring program, please do not hesitate to contact the undersigned.

Sincerely,
Wood Environment & Infrastructure Solutions
a Division of Wood Canada Limited

1.0 INTRODUCTION

Wood is pleased to provide a summary of the Second Quarter (Q2) 2018 results for the ambient air quality monitoring program undertaken at the Rainy River Mine located in northwestern Ontario. Two sampling stations were established in May 2015: one to the south of the Site near the beginning of the Highway 600 realignment at Tait Road, and one to the east of the Site on Gallinger Road (Figures 2-1, 2-2 and 2-3).

New Gold Inc. (New Gold) staff operate and maintain the sampling stations. Wood staff performed quarterly calibrations, provided technical guidance to New Gold field staff, communicated with the laboratory staff as required, and prepared the data summary reports.

This Quarterly Ambient Air Quality Report addresses the required elements of a Quarterly Report defined in the *Operations Manual for Air Quality Monitoring in Ontario* (MECP 2016b), hereafter referred to as the Operations Manual. Specifically, the following information is provided:

- Summary statistics;
- Sampling dates (start and end where applicable); and
- A summary of exceedances of an Ontario Standard, Ambient Air Quality Criterion (AAQC), or Canadian Ambient Air Quality Standard (CAAQS).

The purpose of the air monitoring program is to quantify potential air quality effects associated with activities related to the Mine. The monitoring program consists of:

- Two High Volume (Hi-Vol) samplers for discrete sampling of Total Suspended Particulate (TSP) and metals;
- Two PQ200 samplers for discrete sampling of respirable particulate matter ($PM_{2.5}$);
- Two standard passive dustfall collection units;
- Two passive sampling enclosures each measuring NO_2 and SO_2; and
- One meteorological station to obtain real-time site wind speed, wind direction, temperature, relative humidity, and precipitation.

2.0 MONITORING STATIONS

The ambient monitoring stations were sited in accordance with the criteria stipulated in the MECP Operations Manual (MECP 2018).

The general location for the two stations is shown in Figure 2-1. UTM co-ordinates for each station based upon NAD 83, are presented in Table 2-1. Photographs showing each station and the equipment installed are presented as Figures 2-2 and 2-3.

There were no changes to the stations or station locations in Q2 2018.

3.0 ANALYTICAL AND MONITORING METHODS

3.1 TSP and Metals

The TSP concentrations were determined using the standard gravimetric reference methods approved by the United States Environmental Protection Agency (US EPA) and the Ontario Ministry of the Environment, Conservation and Parks (MECP), as described in the Operations Manual (MECP 2016b). Measurements of 24-hour average TSP and metal concentrations were collected as specified in the Operations Manual (MECP 2016b); particulate samples were collected every sixth day as per the North American schedule (US EPA 2017). Sampling was performed with Hi-Vol samplers (brush motor and mass flow controlled). Metals and metalloids analyzed included the following: arsenic (As), cadmium (Cd), chromium (Cr), cobalt (Co), copper (Cu), iron (Fe), lead (Pb), manganese (Mn), nickel (Ni), selenium (Se), vanadium (V) and zinc (Zn). A metalloid is an element such as As that has both metallic and non-metallic properties.

The lowest detectable limit of total particulate on the filter is 2.3 milligrams (mg). A typical 24-hour sample volume of 1,630 m^3 results in a method detection limit of 1.4 micrograms per cubic metre ($\mu g/m^3$).

Metal concentrations were determined using standard Inductively Coupled Plasma Atomic Emission Spectroscopy (ICP/AES) methodology. Method detection limits are as shown on the data sheets in Appendix A-1.

3.2 $PM_{2.5}$

Sampling was performed with PQ200 samplers. $PM_{2.5}$ concentrations were determined using the standard gravimetric reference methods approved by the US EPA and the MECP, as described in the Operations Manual (MECP 2016b). $PM_{2.5}$ measurements were collected over a 24-hour period to match the averaging time for the Canadian Ambient Air Quality Standard (CAAQS); particulate samples were collected every sixth day as per the North American schedule (US EPA 2017).

The lowest detectable limit of $PM_{2.5}$ on the Teflon filters is 1 µg. A typical 24-hour sample volume of 24 m^3 results in a method detection limit of 0.04 $\mu g/m^3$.

3.3 Total Dustfall

Water soluble and insoluble portions of dustfall were determined using ASTM method D-1739-98 and the British Columbia Ministry of Environment method outlined in Section G of Air Constituents – Inorganic (MECP 2016c). Standard dustfall samplers were used to measure total dustfall deposition. The method detection limit for total dustfall is 0.3 g/m^2/30 days. Bird deterrents were added in Q3 2017 with the goal of reducing contamination.

3.4 Passive Sampling for SO_2 and NO_2

SO_2 and NO_2 concentrations were monitored with passive sampling devices. The exposed permeation filters were analyzed by the Maxxam Analytics Inc. laboratory (Edmonton, Alberta). Testing was performed using methodology developed, approved and validated by Alberta Environment with the support of the Alberta Research Council, the Clean Air Strategic Alliance of Alberta, and the National Research Council of Canada, and following the Standard Operating Procedures for Trace Gas Passive Sampling outlined in the Operations Manual (MECP 2016b).

Sample uptake is dependent on temperature, relative humidity and wind speed. Analytical results are adjusted for these meteorological parameters measured during the exposure period (monthly averages). Required meteorological data were obtained from the Environment and Climate Change Canada website. Fort Frances meteorological station (Climate ID 6022474) is downloaded by Maxxam Analytics with each sample submission. For both SO_2 and NO_2, the analytical method detection limit is in the order of 0.1 parts per billion (ppb). Validation tests conducted in Alberta show that results from passive sampling are typically within 10% of those obtained from sampling with continuous analyzers for 30-day exposure periods.

Since there are no MECP guidelines for monthly concentrations of SO_2 and NO_2 obtained from passive sampling, the data is only used for screening purposes. For NO_2, the monthly results were compared to the MECP 24-hour AAQC converted to an equivalent 30-day average (78 µg/m^3) using the methodology outlined in the *Procedure for Preparing an Emission Summary and Dispersion Modelling Report* (MECP 2017). For SO_2, the results were compared against the 30-day Alberta Ambient Air Quality Objective of 30 µg/m^3 (AEP 2016).

3.5 Field Operations

3.5.1 Hi-Vol Samplers

To meet the requirements of 1-in-6 day sampling schedule, stations were visited once every six days. The exposed filter was recovered and a pre-weighed filter installed for the subsequent sample run. Additional visits were made to resolve instrumentation issues and perform flow calibration checks and preventative maintenance.

Wood staff performed flow, temperature, and barometric pressure calibrations using an electronic BGI flow calibrator. The flows were calibrated to 16.7 litres per minute (LPM) for each station. Q2 Calibrations were performed on:

- February 21, 2018 – All hi-vols calibrated; and
- May 24, 2018 – All hi-vols calibrated.

3.5.2 PQ200 Samplers

To meet the requirements of 1-in-6 day sampling schedule, stations were visited once every six days. The exposed filter was recovered and a pre-weighed filter installed for the subsequent sample run.

Additional visits were made to resolve instrumentation issues and perform flow calibration checks and preventative maintenance.

Wood staff performed flow, temperature, and barometric pressure calibrations using an electronic BGI flow calibrator. The flows were calibrated to 16.7 litres per minute (LPM) for each station. Q2 Calibrations were performed on:

- February 21, 2018 – All PQ200s calibrated; and
- May 24, 2018 – All PQ200s calibrated.

3.5.3 Dustfall Samplers

The dustfall samplers containing algaecide were changed every month, as required. Dustfall jars were provided by the laboratory with screw-on lids to prevent sample loss during transport.

3.5.4 Passive Samplers

The permeation filters in the passive samplers were changed every month, as required. Permeation filters were kept in filter cassettes inside Ziploc bags until deployed to prevent premature exposure. After the sample was collected, the filter was placed back in its cassette and into a Ziploc bag for shipment to the lab.

3.5.5 Performance and Site Audits

There were no MECP audits conducted in Q2 2018.

3.5.6 Equipment and Sampling Issues

During Q2 2018, the ambient air monitoring program was successful in collecting sufficient valid data to fulfil the requirements of the MECP Operations Manual. A number of invalid samples were collected and are discussed below:

- April 14: $PM_{2.5}$ samples at the Gallinger and Tait Road stations were invalidated due a timer error with both samplers.
- The May 2018 dustfall Gallinger Road sample was invalidated due the sample being contaminated with foreign organic matter (decayed insects, etc.).

4.0 RESULTS

Sampling program results for Q2 2018 are presented in Appendix A-1 for the particulate and metals data, Appendix A-2 for the dustfall data and Appendix A-3 for the passive SO_2 and NO_2 data. For the purpose of performing statistical analyses following MECP protocol, a value of half the detection limit was substituted for concentrations less than the detection limit.

For comparative purposes, the MECP AAQC and CAAQS values are presented, where available, noting that the AAQCs are numerically equivalent to the Ontario Regulation 419/05 Standards and Air Contaminant Benchmarks (ACBs) where the averaging times are equivalent.

Summaries of the statistical analyses for Q2 2018 for the TSP, metals, and $PM_{2.5}$ concentrations are presented in Tables 4-1, 4-2, and 4-3, respectively. During the quarter, the 1 in 6-day sampling schedule presented a possible 15 sampling days between April 1 and June 30, 2018.

A summary of the statistical analyses for Q2 2018 for the total dustfall data is presented in Table 4-4.

A summary of the statistical analysis for the Q2 2018 passive SO_2 and NO_2 results is presented in Table 4-5.

4.1 TSP and Metals

The Gallinger Road and Tait Road stations both collected 15 valid samples, respectively, resulting in 100% valid data for Q2 2018.

For the quarter, the geometric mean TSP concentrations were 36.8 µg/m^3 for the Tait Road station and 42.2 µg/m^3 for the Gallinger Road station. Values reported by the laboratory as below the detection limit were, by convention, substituted with one-half of the detection limit. The maximum 24-hour concentration for TSP was 115 µg/m^3 at the Tait Road station (April 2, 2018), and 464 µg/m^3 at the Gallinger Road station (April 8, 2018).

The only exceedances of an MECP AAQC measured for any of TSP, metals, or metalloids in Q2 2018 was at the Gallinger Road Station on April 8, 2018 where a TSP concentration of 464 µg/m^3 (387% of AAQC) and the iron (Fe) concentration of 8.35 µg/m^3 (209% of AAQC) were measured and conservatively assuming all of the iron present was metallic.

The rolling 30-day average lead concentrations at both stations were at maximum 2.13% of the 30-day lead AAQC (0.2 µg/m^3) in Q2 2018.

Appendix A-1 and Figure 4-1 present individual sample data. The Q2 2018 TSP and metals summary statistics are summarized in Tables 4-1 and 4-2, respectively.

4.2 $PM_{2.5}$

The Gallinger Road and Tait Road stations both collected 14 valid samples, respectively, resulting in 93% valid data for Q2 2018. A timer error occurred at both stations on April 14, 2018, resulting in no sample collection which is identified as an invalid sample in the summary tables.

Values reported by the laboratory as below the detection limit were, by convention, substituted with one-half of the detection limit. The maximum 24-hour concentration for $PM_{2.5}$ was 8.12 µg/m^3 at the Tait Road station (May 26, 2018), and 12.7 µg/m^3 at the Gallinger Road station (April 8, 2018).

There were no $PM_{2.5}$ exceedances of the AAQC of 30 µg/m^3 or CAAQS (ECCC 2013) of 28 µg/m^3 measured in Q2 2018. Appendix A-1 and Figure 4-2 present individual sample data.

The Q2 2018 $PM_{2.5}$ summary statistics are summarized in Table 4-3.

4.3 Total Dustfall

In Q2 2018, three valid samples were collected at each station, with the exception of the March 2018 Gallinger Road sample which was invalidated due to contamination. Each dustfall jar was exposed for approximately 30-days to coincide with each calendar month in the quarter.

There were no dustfall exceedances of the 30-day AAQC of 7 g/m^2 measured in Q2 2018.

A summary of the results is presented in Table 4-4 and the monthly results are presented in Appendix A-2.

4.4 Passive SO_2 and NO_2

In Q2 2018, three valid samples were collected at each station for each of SO_2 and NO_2.

There are no MECP standards, guidelines or AAQCs for SO_2 or NO_2 for a 30-day averaging period. The 30-day measured average SO_2 or NO_2 concentrations allow for future analysis of trends in the ambient concentrations, to identify any notable increases, and for potential comparison with dispersion modelling results.

For NO_2, the monthly results were compared to the MECP 24-hour AAQC converted to an equivalent 30-day average (78 µg/m^3) using the methodology outlined in the *Procedure for Preparing an Emission Summary and Dispersion Modelling Report* (MECP 2017). For SO_2, the results were compared against the Alberta Ambient Air Quality Objective of 30 µg/m^3 (AEP 2017).

A summary of the passive results is presented in Table 4-5 and the monthly results are presented in Appendix A-3.

4.5 Evaluation of Effects of Abatement Measures on Monitored Concentrations

The Rainy River Mine has a comprehensive Best Management Practices Plan (BMPP) for Fugitive Dust approved by the MECP as part of the ECA review process. This BMPP effectively controls the generation and dispersion of dust such that the particulate matter measured at the two ambient monitoring stations was below the AAQC for all Q2 2018 samples, with the exception of one TSP and iron concentration measured on April 8, 2018 at the Gallinger Road Station.

Table 4-1: Summary Statistics for Q2 2018 TSP Concentration Data

Statistics	Tait Road (SW)	Gallinger Road (NE)

5.0 CONCLUSIONS

This report summarizes the data collected in Q2 2018 for the ambient air quality monitoring program at the Rainy River Mine.

The monitoring program collects TSP, metals, $PM_{2.5}$, total dustfall, NO_2, and SO_2 ambient air quality data from two monitoring stations that were installed and commissioned in May 2015.

A summary of the Q2 2018 ambient air quality monitoring program results is provided below:

- There were 15 valid TSP samples collected at both stations resulting in 100% sample validity. Metal and metalloid concentrations were measured on each of the TSP filters.
- The only measured exceedances of an MECP AAQC for TSP, metals, or metalloids in Q2 2018 was at the Gallinger Road Station. On April 8, 2018 a TSP concentration of 464 µg/m^3 (387% of AAQC) and an iron (Fe) concentration of 8.35 µg/m^3 (209% of AAQC) were measured.
- There were 14 valid $PM_{2.5}$ samples collected at the Tait and Gallinger Road stations, (93% valid data). There were no exceedances of the 24-hour $PM_{2.5}$ CAAQS in Q2 2018.
- There were 3 valid dustfall samples collected at the Tait Road station (100% sample validity), and 2 valid dustfall samples collected at the Gallinger Road Station (67% validity). There were no exceedances of the 30-day dustfall AAQC in Q2 2018.
- There were 3 valid passive SO_2 and NO_2 samples collected at each of the two stations (100% sample validity). There were no exceedances of AEP Criterion for SO_2 or the 30-day equivalent AAQC for NO_2 in Q2 2018.

7.0 CLOSING

This *Rainy River Mine Ambient Air Quality Monitoring Program Second Quarter 2018 Report* was prepared by Wood for the sole benefit of New Gold Inc. for specific application to the Rainy River Mine. The quality of information, conclusions and estimates contained herein are consistent with the level of effort involved in Wood's services and based on:

i) information available at the time of preparation;

ii) data supplied by outside sources; and

iii) the assumptions, conditions and qualifications set forth in this document.

This report is intended to be used by New Gold only, and its nominated representatives, subject to the terms and conditions of its contract with Wood. Any other use of, or reliance on, this report by any third party is at that party's sole risk. This report has been prepared in accordance with generally accepted industry-standard practices. No other warranty, expressed or implied, is made.

If you require further information regarding the above or the Mine in general, please contact the undersigned at (905) 568-2929. Thank you for the opportunity to be of service to New Gold Inc.

Yours truly,
Wood Environment & Infrastructure Solutions
a Division of Wood Canada Limited

Dear Ms. St. Jean:

Re: Rainy River Mine
Ambient Air Quality Monitoring Program
Third Quarter 2018 Report

Wood Environment & Infrastructure Solutions, a Division of Wood Canada Limited (hereinafter referred to as Wood), is a leading environment and infrastructure, engineering, consulting and project management organization. Our team of professionals provides a full range of services to clients in a wide range of sectors including government, industrial & commercial, water, transportation, minerals & metals, oil & gas clients and clean energy.

Wood is submitting to New Gold Inc. (New Gold) the attached summary report of the results for the ambient air quality monitoring program for the third quarter of 2018 at the Rainy River Mine. The monitoring program consists of two air quality monitoring stations that were established in May 2015: one to the south of the Site near the beginning of the Highway 600 reroute on Tait Road, and one to the east of the Site on Gallinger Road. The sampling stations are operated and maintained by New Gold staff; Wood staff performed quarterly calibrations, provided technical guidance to New Gold field staff, communicated with the laboratory staff as required, and prepared the data summary report.

This report revision includes all laboratory data from Q3 2018.

Wood will supply the MECP with raw and edited data per the Operations Manual for Air Quality Monitoring in Ontario (MECP 2016b).

The key finding(s) of the Q3 2018 monitoring are as follows:

- There were no exceedances of the TSP, dustfall or metals/metalloids Ambient Air Quality Criteria AAQC, $PM_{2.5}$ Canadian Ambient Air Quality Standard CAAQS, or the SO_2, or NO_2 criteria measured in Q3 2018.

The measured TSP and $PM_{2.5}$ concentrations for the Q3 2018 are depicted in Figures CL-1 and CL-2.

'Wood' is a trading name for John Wood Group PLC and its subsidiaries

Note that quarterly reports do not include interpretation of the data (i.e. exceedances); interpretation of results is included in the annual reporting. Should you have any questions or wish to discuss the air monitoring program, please do not hesitate to contact the undersigned.

Sincerely,

Wood Environment & Infrastructure Solutions
a Division of Wood Canada Limited

1.0 INTRODUCTION

This report presents a summary of the Third Quarter (Q3) 2018 results for the ambient air quality monitoring program undertaken at the Rainy River Mine located in northwestern Ontario. Two sampling stations were established in May 2015: one to the south of the Site near the beginning of the Highway 600 realignment at Tait Road, and one to the east of the Site on Gallinger Road (Figures 2-1, 2-2 and 2-3).

New Gold Inc. (New Gold) staff operate and maintain the sampling stations. Wood staff performed quarterly calibrations, provided technical guidance to New Gold field staff, communicated with the laboratory staff as required, and prepared the data summary reports. An extended completion date was issued by the laboratory for the final three samples in September, as well as the September dustfall samples. After consultation with the laboratory they agreed to try to meet our reporting deadline, which occurred for all parameters except metals. This report revision includes the complete laboratory dataset.

This Quarterly Ambient Air Quality Report addresses the required elements of a Quarterly Report defined in the *Operations Manual for Air Quality Monitoring in Ontario* (MECP 2016b), hereafter referred to as the Operations Manual. Specifically, the following information is provided:

- Summary statistics;
- Sampling dates (start and end where applicable); and
- A summary of exceedances of an Ontario Standard, Ambient Air Quality Criterion (AAQC), or Canadian Ambient Air Quality Standard (CAAQS).

The purpose of the air monitoring program is to quantify potential air quality effects associated with activities related to the Mine. The monitoring program consists of:

- Two High Volume (Hi-Vol) samplers for discrete sampling of Total Suspended Particulate (TSP) and metals;
- Two PQ200 samplers for discrete sampling of respirable particulate matter ($PM_{2.5}$);
- Two standard passive dustfall collection units;
- Two passive sampling enclosures each measuring NO_2 and SO_2; and
- One meteorological station to obtain real-time site wind speed, wind direction, temperature, relative humidity, and precipitation.

2.0 MONITORING STATIONS

The ambient monitoring stations were sited in accordance with the criteria stipulated in the MECP Operations Manual (MECP 2018).

The general location for the two stations is shown in Figure 2-1. UTM co-ordinates for each station based upon NAD 83, are presented in Table 2-1. Photographs showing each station and the equipment installed are presented as Figures 2-2 and 2-3.

There were no changes to the stations or station locations in Q3 2018.

3.0 ANALYTICAL AND MONITORING METHODS

3.1 TSP and Metals

The TSP concentrations were determined using the standard gravimetric reference methods approved by the United States Environmental Protection Agency (US EPA) and the Ontario Ministry of the Environment, Conservation and Parks (MECP), as described in the Operations Manual (MECP 2016b). Measurements of 24-hour average TSP and metal concentrations were collected as specified in the Operations Manual (MECP 2016b); particulate samples were collected every sixth day as per the North American schedule (US EPA 2017). Sampling was performed with Hi-Vol samplers (brush motor and mass flow controlled). Metals and metalloids analyzed included the following: arsenic (As), cadmium (Cd), chromium (Cr), cobalt (Co), copper (Cu), iron (Fe), lead (Pb), manganese (Mn), nickel (Ni), selenium (Se), vanadium (V) and zinc (Zn). A metalloid is an element such that has both metallic and non-metallic properties.

The lowest detectable limit of total particulate on the filter is 2.3 milligrams (mg). A typical 24-hour sample volume of 1,630 m^3 results in a method detection limit of 1.4 micrograms per cubic metre ($\mu g/m^3$).

Metal concentrations were determined using standard Inductively Coupled Plasma Atomic Emission Spectroscopy (ICP/AES) methodology. Method detection limits are as shown on the data sheets in Appendix A-1.

3.2 $PM_{2.5}$

Sampling was performed with PQ200 samplers. $PM_{2.5}$ concentrations were determined using the standard gravimetric reference methods approved by the US EPA and the MECP, as described in the Operations Manual (MECP 2016b). $PM_{2.5}$ measurements were collected over a 24-hour period to match the averaging time for the Canadian Ambient Air Quality Standard (CAAQS); particulate samples were collected every sixth day as per the North American schedule (US EPA 2017).

The lowest detectable limit of $PM_{2.5}$ on the Teflon filters is 1 µg. A typical 24-hour sample volume of 24 m^3 results in a method detection limit of 0.04 $\mu g/m^3$.

3.3 Total Dustfall

Water soluble and insoluble portions of dustfall were determined using ASTM method D-1739-98 and the British Columbia Ministry of Environment method outlined in Section G of Air Constituents – Inorganic (MECP 2016c). Standard dustfall samplers were used to measure total dustfall deposition. The method detection limit for total dustfall is 0.3 g/m^2/30 days. Bird deterrents were added in Q3 2017 with the goal of reducing contamination.

3.4 Passive Sampling for SO_2 and NO_2

SO_2 and NO_2 concentrations were monitored with passive sampling devices. The exposed permeation filters were analyzed by the Maxxam Analytics Inc. laboratory (Edmonton, Alberta). Testing was performed using methodology developed, approved and validated by Alberta Environment with the support of the Alberta Research Council, the Clean Air Strategic Alliance of Alberta, and the National Research Council of Canada, and following the Standard Operating Procedures for Trace Gas Passive Sampling outlined in the Operations Manual (MECP 2016b).

Sample uptake is dependent on temperature, relative humidity and wind speed. Analytical results are adjusted for these meteorological parameters measured during the exposure period (monthly averages). Required meteorological data were obtained from the Environment and Climate Change Canada website. Fort Frances meteorological station (Climate ID 6022474) is downloaded by Maxxam Analytics with each sample submission. For both SO_2 and NO_2, the analytical method detection limit is in the order of 0.1 parts per billion (ppb). Validation tests conducted in Alberta show that results from passive sampling are typically within 10% of those obtained from sampling with continuous analyzers for 30-day exposure periods.

Since there are no MECP guidelines for monthly concentrations of SO_2 and NO_2 obtained from passive sampling, the data is only used for screening purposes. For NO_2, the monthly results were compared to the MECP 24-hour AAQC converted to an equivalent 30-day average (78 µg/m^3) using the methodology outlined in the *Procedure for Preparing an Emission Summary and Dispersion Modelling Report* (MECP 2017). For SO_2, the results were compared against the 30-day Alberta Ambient Air Quality Objective of 30 µg/m^3 (AEP 2016).

3.5 Field Operations

3.5.1 Hi-Vol Samplers

To meet the requirements of 1-in-6 day sampling schedule, stations were visited once every six days. The exposed filter was recovered and a pre-weighed filter installed for the subsequent sample run. Additional visits were made to resolve instrumentation issues and perform flow calibration checks and preventative maintenance.

Wood staff performed flow, temperature, and barometric pressure calibrations using an electronic BGI flow calibrator. The flows were calibrated to 16.7 litres per minute (LPM) for each station. Q3 Calibrations were performed on:

- May 24, 2018 – All hi-vols calibrated; and
- August 20, 2018 – All hi-vols calibrated.

3.5.2 PQ200 Samplers

To meet the requirements of 1-in-6 day sampling schedule, stations were visited once every six days. The exposed filter was recovered and a pre-weighed filter installed for the subsequent sample run. Additional visits were made to resolve instrumentation issues and perform flow calibration checks and preventative maintenance.

Wood staff performed flow, temperature, and barometric pressure calibrations using an electronic BGI flow calibrator. The flows were calibrated to 16.7 litres per minute (LPM) for each station. Q3 Calibrations were performed on:

- May 24, 2018 – All PQ200s calibrated; and
- August 20, 2018– All PQ200s calibrated.

3.5.3 Dustfall Samplers

The dustfall samplers containing algaecide were changed every month, as required. Dustfall jars were provided by the laboratory with screw-on lids to prevent sample loss during transport.

3.5.4 Passive Samplers

The permeation filters in the passive samplers were changed every month, as required. Permeation filters were kept in filter cassettes inside Ziploc bags until deployed to prevent premature exposure. After the sample was collected, the filter was placed back in its cassette and into a Ziploc bag for shipment to the lab.

3.5.5 Performance and Site Audits

There were no MECP audits conducted in Q3 2018.

3.5.6 Equipment and Sampling Issues

During Q3 2018, the ambient air monitoring program was successful in collecting sufficient valid data to fulfil the requirements of the MECP Operations Manual. Three samples were invalidated, as discussed below:

- August 24: TSP samples at the Gallinger and Tait Road stations were invalidated due to insufficient volume collection at both samplers.
- September 5: The $PM_{2.5}$ sample at the Gallinger Road station was invalidated due to a sampler error resulting in an approximately 60 hour run time.

4.0 RESULTS

Sampling program results for Q3 2018 are presented in Appendix A-1 for the particulate and metals data, Appendix A-2 for the dustfall data and Appendix A-3 for the passive SO_2 and NO_2 data. For the purpose of performing statistical analyses following MECP protocol, a value of half the detection limit was substituted for concentrations less than the detection limit.

For comparative purposes, the MECP AAQC and CAAQS values are presented, where available, noting that the AAQCs are numerically equivalent to the Ontario Regulation 419/05 Standards and Air Contaminant Benchmarks (ACBs) where the averaging times are equivalent.

Summaries of the statistical analyses for Q3 2018 for the TSP, metals, and $PM_{2.5}$ concentrations are presented in Tables 4-1, 4-2, and 4-3, respectively. During the quarter, the 1 in 6-day sampling schedule presented a possible 15 sampling days between July 1 and September 30, 2018.

A summary of the statistical analyses for Q3 2018 for the total dustfall data is presented in Table 4-4.

A summary of the statistical analysis for the Q3 2018 passive SO_2 and NO_2 results is presented in Table 4-5.

4.1 TSP and Metals

The Gallinger Road and Tait Road stations both collected 15 valid samples, respectively, resulting in 94% valid data for Q3 2018. A sampler error occurred at both stations on August 24th resulting in insufficient volume collection, thus invalidating the sample.

For the quarter, the geometric mean TSP concentrations were 30.3 µg/m^3 for the Tait Road station and 22.3 µg/m^3 for the Gallinger Road station. Values reported by the laboratory as below the detection limit were, by convention, substituted with one-half of the detection limit. The maximum 24-hour concentration for TSP was 77.2 µg/m^3 at the Tait Road station (August 12, 2018), and 55.0 µg/m^3 at the Gallinger Road station (July 1, 2018).

The rolling 30-day average lead concentration at the Tait Road station and Gallinger Road stations was at maximum 0.80% and 1.05%, respectively, of the 30-day lead AAQC (0.2 µg/m^3) in Q3 2018.

Appendix A-1 and Figure 4-1 present individual sample data. The Q3 2018 TSP and metals summary statistics are summarized in Tables 4-1 and 4-2, respectively.

4.2 $PM_{2.5}$

The Gallinger Road station collected 15 valid samples resulting in 94% valid data for Q3 2018. The Tait Road station collected 16 valid samples resulting in 100% valid data. A sampler error occurred at the Gallinger Road station on September 5th resulting in an excessive sample run time, thus invalidating the sample.

Values reported by the laboratory as below the detection limit were, by convention, substituted with one-half of the detection limit. The maximum 24-hour concentration for $PM_{2.5}$ was 24.0 µg/m³ at the Tait Road station (August 12, 2018), and 24.4 µg/m³ at the Gallinger Road station (August 12, 2018).

There were no $PM_{2.5}$ exceedances of the AAQC of 30 µg/m³ or CAAQS (ECCC 2013) of 28 µg/m³ measured in Q3 2018. Appendix A-1 and Figure 4-2 present individual sample data.

The Q3 2018 $PM_{2.5}$ summary statistics are summarized in Table 4-3.

4.3 Total Dustfall

In Q3 2018, three valid samples were collected at each station. Each dustfall jar was exposed for approximately 30-days to coincide with each calendar month in the quarter.

There were no dustfall exceedances of the 30-day AAQC of 7 g/m² measured in Q3 2018.

A summary of the results is presented in Table 4-4 and the monthly results are presented in Appendix A-2.

4.4 Passive SO_2 and NO_2

In Q3 2018, three valid samples were collected at each station for each of SO_2 and NO_2.

There are no MECP standards, guidelines or AAQCs for SO_2 or NO_2 for a 30-day averaging period. The 30-day measured average SO_2 or NO_2 concentrations allow for future analysis of trends in the ambient concentrations, to identify any notable increases, and for potential comparison with dispersion modelling results.

For NO_2, the monthly results were compared to the MECP 24-hour AAQC converted to an equivalent 30-day average (78 µg/m³) using the methodology outlined in the *Procedure for Preparing an Emission Summary and Dispersion Modelling Report* (MECP 2017). For SO_2, the results were compared against the Alberta Ambient Air Quality Objective of 30 µg/m³ (AEP 2017).

A summary of the passive results is presented in Table 4-5 and the monthly results are presented in Appendix A-3.

4.5 Evaluation of Effects of Abatement Measures on Monitored Concentrations

The Rainy River Mine has a comprehensive Best Management Practices Plan (BMPP) for Fugitive Dust approved by the MECP as part of the ECA review process. This BMPP effectively controls the generation and dispersion of dust such that the particulate matter measured at the two ambient monitoring stations was below the AAQC for all Q3 2018 samples.

5.0 CONCLUSIONS

This report summarizes the data collected in Q3 2018 for the ambient air quality monitoring program at the Rainy River Mine.

The monitoring program collects TSP, metals, $PM_{2.5}$, total dustfall, NO_2, and SO_2 ambient air quality data from two monitoring stations that were installed and commissioned in May 2015.

A summary of the Q3 2018 ambient air quality monitoring program results is provided below:

- There were 15 valid TSP samples collected at both stations, resulting in 94% sample validity. Metal and metalloid concentrations were measured on each of the TSP filters. There were no exceedances of the TSP or metals/metalloids AAQC;
- There were 15 valid $PM_{2.5}$ samples collected at the Gallinger Road station, (94% valid data) and 16 valid samples collected at the Tait Road Station, (100% valid data). There were no exceedances of the 24-hour $PM_{2.5}$ CAAQS;
- There were 3 valid dustfall samples collected at the Tait Road Station and Gallinger Road Station, resulting in 100% sample validity. There were no exceedances of the 30-day dustfall AAQC; and
- There were 3 valid passive SO_2 and NO_2 samples collected at each of the two stations, resulting in 100% sample validity. There were no exceedances of AEP Criterion for SO_2 or the 30-day equivalent AAQC for NO_2.

7.0 CLOSING

This *Rainy River Mine Ambient Air Quality Monitoring Program Third Quarter 2018 Report* was prepared by Wood for the sole benefit of New Gold Inc. for specific application to the Rainy River Mine. The quality of information, conclusions and estimates contained herein are consistent with the level of effort involved in Wood's services and based on:

i) information available at the time of preparation;

ii) data supplied by outside sources; and

iii) the assumptions, conditions and qualifications set forth in this document.

This report is intended to be used by New Gold only, and its nominated representatives, subject to the terms and conditions of its contract with Wood. Any other use of, or reliance on, this report by any third party is at that party's sole risk. This report has been prepared in accordance with generally accepted industry-standard practices. No other warranty, expressed or implied, is made.

If you require further information regarding the above or the Mine in general, please contact the undersigned at (905) 568-2929. Thank you for the opportunity to be of service to New Gold Inc.

Yours truly,

Wood Environment & Infrastructure Solutions
a Division of Wood Canada Limited

Emo, Ontario P0W 1E0

Dear Ms. St. Jean:

Re: Rainy River Mine
Ambient Air Quality Monitoring Program
Fourth Quarter 2018 Report

Wood Environment & Infrastructure Solutions, a Division of Wood Canada Limited (hereinafter referred to as Wood), is a leading environment and infrastructure, engineering, consulting and project management organization. Our team of professionals provides a full range of services to clients in a wide range of sectors including government, industrial & commercial, water, transportation, minerals & metals, oil & gas clients and clean energy.

Wood is submitting to New Gold Inc. (New Gold) the attached summary report of the results for the ambient air quality monitoring program for the fourth quarter of 2018 at the Rainy River Mine. The monitoring program consists of two air quality monitoring stations that were established in May 2015: one to the south of the Site near the beginning of the Highway 600 reroute on Tait Road, and one to the east of the Site on Gallinger Road. The sampling stations are operated and maintained by New Gold staff; Wood staff performed quarterly calibrations, provided technical guidance to New Gold field staff, communicated with the laboratory staff as required, and prepared the data summary report.

Wood will supply the MECP with raw and edited data per the Operations Manual for Air Quality Monitoring in Ontario (MECP 2018a).

The key finding(s) of the Q4 2018 monitoring are as follows:

- There were no exceedances of the TSP, dustfall or metals/metalloids Ambient Air Quality Criteria (AAQC), $PM_{2.5}$ Canadian Ambient Air Quality Standard CAAQS, or the SO_2, or NO_2 criteria measured in Q4 2018.

The measured TSP and $PM_{2.5}$ concentrations for the Q4 2018 are depicted in Figures CL-1 and CL-2.

'Wood' is a trading name for John Wood Group PLC and its subsidiaries

Note that quarterly reports do not include interpretation of the data (i.e. exceedances); interpretation of results is included in the annual reporting. Should you have any questions or wish to discuss the air monitoring program, please do not hesitate to contact the undersigned.

Sincerely,

Wood Environment & Infrastructure Solutions
a Division of Wood Canada Limited

1.0 INTRODUCTION

This report presents a summary of the Fourth Quarter (Q4) 2018 results for the ambient air quality monitoring program undertaken at the Rainy River Mine located in northwestern Ontario. Two sampling stations were established in May 2015: one to the south of the Site near the beginning of the Highway 600 realignment at Tait Road, and one to the east of the Site on Gallinger Road (Figures 2-1, 2-2 and 2-3).

New Gold Inc. (New Gold) staff operate and maintain the sampling stations. Wood staff performed quarterly calibrations, provided technical guidance to New Gold field staff, communicated with the laboratory staff as required, and prepared the data summary reports.

This Quarterly Ambient Air Quality Report addresses the required elements of a Quarterly Report defined in the *Operations Manual for Air Quality Monitoring in Ontario* (MECP 2018a), hereafter referred to as the Operations Manual. Specifically, the following information is provided:

- Summary statistics;
- Sampling dates (start and end where applicable); and
- A summary of exceedances of an Ontario Standard, Ambient Air Quality Criterion (AAQC), or Canadian Ambient Air Quality Standard (CAAQS).

The purpose of the air monitoring program is to quantify potential air quality effects associated with activities related to the Mine. The monitoring program consists of:

- Two High Volume (Hi-Vol) samplers for discrete sampling of Total Suspended Particulate (TSP) and metals;
- Two PQ200 samplers for discrete sampling of respirable particulate matter ($PM_{2.5}$);
- Two standard passive dustfall collection units;
- Two passive sampling enclosures each measuring NO_2 and SO_2; and
- One meteorological station to obtain real-time site wind speed, wind direction, temperature, relative humidity, and precipitation.

2.0 MONITORING STATIONS

The ambient monitoring stations were sited in accordance with the criteria stipulated in the MECP Operations Manual (MECP 2018a).

The general location for the two stations is shown in Figure 2-1. UTM co-ordinates for each station based upon NAD 83, are presented in Table 2-1. Photographs showing each station and the equipment installed are presented as Figures 2-2 and 2-3.

There were no changes to the stations or station locations in Q4 2018.

RAINY RIVER MINE

Ambient Air Monitoring Northeast Monitoring Station

PROJECT N°: TC111504	**FIGURE: 2-3**
SCALE: 1:700	DATE: May 2018

3.0 ANALYTICAL AND MONITORING METHODS

3.1 TSP and Metals

The TSP concentrations were determined using the standard gravimetric reference methods approved by the United States Environmental Protection Agency (US EPA) and the Ontario Ministry of the Environment, Conservation and Parks (MECP), as described in the Operations Manual (MECP 2018a). Measurements of 24-hour average TSP and metal concentrations were collected as specified in the Operations Manual (MECP 2018a); particulate samples were collected every sixth day as per the North American schedule (US EPA 2018). Sampling was performed with mass flow controlled Hi-Vol samplers (brush motor). All filters were analyzed for the following metals and metalloids: arsenic (As), cadmium (Cd), chromium (Cr), cobalt (Co), copper (Cu), iron (Fe), lead (Pb), manganese (Mn), nickel (Ni), selenium (Se), vanadium (V) and zinc (Zn). A metalloid is an element such that has both metallic and non-metallic properties.

The lowest detectable limit of total particulate on the filter is 2.3 milligrams (mg). A typical 24-hour sample volume of 1,630 m^3 results in a method detection limit of 1.4 micrograms per cubic metre ($\mu g/m^3$).

Metal concentrations were determined using standard Inductively Coupled Plasma Atomic Emission Spectroscopy (ICP/AES). Method detection limits are as shown in the sampling summary in Appendix A-1.

3.2 $PM_{2.5}$

Sampling was performed with PQ200 samplers. $PM_{2.5}$ concentrations were determined using the standard gravimetric reference methods approved by the US EPA and the MECP, as described in the Operations Manual (MECP 2018a). $PM_{2.5}$ measurements were collected over a 24-hour period to match the averaging time for the Canadian Ambient Air Quality Standard (CAAQS); particulate samples were collected every sixth day as per the North American schedule (US EPA 2018).

The lowest detectable limit of $PM_{2.5}$ on the Teflon filters is 1 µg. A typical 24-hour sample volume of 24 m^3 results in a method detection limit of 0.04 $\mu g/m^3$.

3.3 Total Dustfall

Water soluble and insoluble portions of dustfall were determined using ASTM method D-1739-98 (MOECC 2016) and the British Columbia Ministry of Environment method outlined in Section G of Air Constituents – Inorganic (BCMOE 2007). Standard dustfall samplers were used to measure total dustfall deposition. The method detection limit for total dustfall is 0.3 g/m^2/30 days. Bird deterrents were added in Q3 2017 with the goal of reducing contamination.

3.4 Passive Sampling for SO_2 and NO_2

SO_2 and NO_2 concentrations were monitored with passive sampling devices. The exposed permeation filters were analyzed by the Maxxam Analytics Inc. laboratory (Edmonton, Alberta). Testing was performed using methodology developed, approved and validated by Alberta Environment with the support of the Alberta Research Council, the Clean Air Strategic Alliance of Alberta, and the National Research Council of Canada, and following the Standard Operating Procedures for Trace Gas Passive Sampling outlined in the Operations Manual (MECP 2018a).

Sample uptake is dependent on temperature, relative humidity and wind speed. Analytical results are adjusted for these meteorological parameters measured during the exposure period (monthly averages). Required meteorological data were obtained from the Environment and Climate Change Canada website. Fort Frances meteorological station (Climate ID 6022474) is downloaded by Maxxam Analytics with each sample submission. For both SO_2 and NO_2, the analytical method detection limit is in the order of 0.1 parts per billion (ppb). Validation tests conducted in Alberta show that results from passive sampling are typically within 10% of those obtained from sampling with continuous analyzers for 30-day exposure periods.

Since there are no MECP guidelines for monthly concentrations of SO_2 and NO_2 obtained from passive sampling, the data is only used for screening purposes. For NO_2, the monthly results were compared to the MECP 24-hour AAQC converted to an equivalent 30-day average (78 µg/m^3) using the methodology outlined in the *Procedure for Preparing an Emission Summary and Dispersion Modelling Report* (MECP 2018b). For SO_2, the results were compared against the 30-day Alberta Ambient Air Quality Objective of 30 µg/m^3 (AEP 2016).

3.5 Field Operations

3.5.1 Hi-Vol Samplers

To meet the requirements of 1-in-6 day sampling schedule, stations were visited once every six days. The exposed filter was recovered and a pre-weighed filter installed for the subsequent sample run.

Wood staff performed flow, temperature, and barometric pressure calibrations using an electronic BGI flow calibrator. The flows were calibrated to 16.7 litres per minute (LPM) for each station. Q4 Calibrations were performed on:

- November 21, 2018 – All Hi-Vols calibrated.

3.5.2 PQ200 Samplers

To meet the requirements of 1-in-6 day sampling schedule, stations were visited once every six days. The exposed filter was recovered and a pre-weighed filter installed for the subsequent sample run.

Wood staff performed flow, temperature, and barometric pressure calibrations using an electronic BGI flow calibrator. The flows were calibrated to 16.7 litres per minute (LPM) for each station. Q4 Calibrations were performed on:

- November 21, 2018 – All PQ200s calibrated.

3.5.3 Dustfall Samplers

The dustfall samplers, containing isopropanol in the winter to prevent freezing, were changed every month, as required. Dustfall jars were provided by the laboratory with screw-on lids to prevent sample loss during transport.

3.5.4 Passive Samplers

The permeation filters in the passive samplers were changed every month, as required. Permeation filters were kept in filter cassettes inside Ziploc bags until deployed to prevent premature exposure. After the sample was collected, the filter was placed back in its cassette and into a Ziploc bag for shipment to the lab.

3.5.5 Performance and Site Audits

There were no MECP audits conducted in Q4 2018.

3.5.6 Equipment and Sampling Issues

During Q4 2018, nine samples were invalidated, as discussed below:

- October 29: TSP sample at the Tait Road station was invalidated due to excessive run time.
- November 4: TSP samples at the Tait Road and Gallinger Road stations were invalidated due to excessive run times.
- November 10: TSP sample at the Gallinger Road station was invalidated due to excessive run time.
- November 16: TSP sample at the Gallinger Road station was invalidated due to excessive run time.
- November 28: TSP sample at the Gallinger Road station was invalidated due to insufficient run time.
- December 16: $PM_{2.5}$ sample at the Gallinger Road station was invalidated due to sampler failure.
- December 22: $PM_{2.5}$ sample at the Gallinger Road station was invalidated due to sampler failure.
- December 28: $PM_{2.5}$ sample at the Gallinger Road station was invalidated due to sampler failure.

4.0 RESULTS

Sampling program results for Q4 2018 are presented in Appendix A-1 for the particulate and metals data, Appendix A-2 for the dustfall data and Appendix A-3 for the passive SO_2 and NO_2 data. For the purpose of performing statistical analyses following MECP protocol, a value of half the detection limit was substituted for concentrations less than the detection limit.

For comparative purposes, the MECP AAQC and CAAQS values are presented, where available, noting that the AAQCs are numerically equivalent to the Ontario Regulation 419/05 Standards and Air Contaminant Benchmarks (ACBs) where the averaging times are equivalent.

Summaries of the statistical analyses for Q4 2018 for the TSP, metals, and $PM_{2.5}$ concentrations are presented in Tables 4-1, 4-2, and 4-3, respectively. During the quarter, the 1 in 6-day sampling schedule presented a possible 15 sampling days between October 1 and December 31, 2018.

A summary of the statistical analyses for Q4 2018 for the total dustfall data is presented in Table 4-4.

A summary of the statistical analysis for the Q4 2018 passive SO_2 and NO_2 results is presented in Table 4-5.

4.1 TSP and Metals

The Gallinger Road station collected 11 valid samples, respectively, resulting in 73% valid data for Q4 2018. The Tait Road station collected 13 valid samples, respectively, resulting in 87% valid data for Q4 2018. A list of issues that occurred is provided in Section 3.5.6.

For the quarter, the geometric mean TSP concentrations were 16.0 µg/m^3 for the Tait Road station and 9.4 µg/m^3 for the Gallinger Road station. Values reported by the laboratory as below the detection limit were, by convention, substituted with one-half of the detection limit. The maximum 24-hour concentration for TSP was 116.9 µg/m^3 at the Tait Road station (November 10, 2018), and 44.3 µg/m^3 at the Gallinger Road station (December 16, 2018).

The rolling 30-day average lead concentration at the Tait Road station and Gallinger Road stations was at maximum 2% and 1%, respectively, of the 30-day lead AAQC (0.2 µg/m^3) in Q4 2018.

Appendix A-1 and Figure 4-1 present individual sample data. The Q4 2018 TSP and metals summary statistics are summarized in Tables 4-1 and 4-2, respectively.

4.2 $PM_{2.5}$

The Gallinger Road station collected 12 valid samples resulting in 80% valid data for Q4 2018. The Tait Road station collected 15 valid samples resulting in 100% valid data. Issues with the sampling pump occurred at the end of December, resulting in three invalid samples at the Gallinger Road station.

Values reported by the laboratory as below the detection limit were, by convention, substituted with one-half of the detection limit. The maximum 24-hour concentration for $PM_{2.5}$ was 6.91 µg/m^3 at the Tait Road station (November 22, 2018), and 6.99 µg/m^3 at the Gallinger Road station (December 10, 2018).

There were no $PM_{2.5}$ exceedances of the AAQC (MECP 2018b) of 30 µg/m^3 or CAAQS (ECCC 2013) of 28 µg/m^3 measured in Q4 2018. Appendix A-1 and Figure 4-2 present individual sample data. The Q4 2018 $PM_{2.5}$ summary statistics are summarized in Table 4-3.

4.3 Total Dustfall

In Q4 2018, three valid samples were collected at each station. Each dustfall jar was exposed for approximately 30-days to coincide with each calendar month in the quarter.

There were no dustfall exceedances of the 30-day AAQC of 7 g/m^2 measured in Q4 2018. A summary of the results is presented in Table 4-4 and the monthly results are presented in Appendix A-2.

4.4 Passive SO_2 and NO_2

In Q4 2018, three valid samples were collected at each station for each of SO_2 and NO_2.

There are no MECP standards, guidelines or AAQCs for SO_2 or NO_2 for a 30-day averaging period. The 30-day measured average SO_2 or NO_2 concentrations allow for future analysis of trends in the ambient concentrations, to identify any notable increases, and for potential comparison with dispersion modelling results.

For NO_2, the monthly results were compared to the MECP 24-hour AAQC converted to an equivalent 30-day average (78 µg/m^3) using the methodology outlined in the *Procedure for Preparing an Emission Summary and Dispersion Modelling Report* (MECP 2018b). For SO_2, the results were compared against the Alberta Ambient Air Quality Objective of 30 µg/m^3 (AEP 2017).

A summary of the passive results is presented in Table 4-5 and the monthly results are presented in Appendix A-3.

4.5 Evaluation of Effects of Abatement Measures on Monitored Concentrations

The Rainy River Mine has a comprehensive Best Management Practices Plan (BMPP) for Fugitive Dust approved by the MECP as part of the ECA review process. This BMPP effectively controls the generation and dispersion of dust such that the particulate matter measured at the two ambient monitoring stations was below the AAQC for all Q4 2018 samples.

5.0 CONCLUSIONS

This report summarizes the data collected in Q4 2018 for the ambient air quality monitoring program at the Rainy River Mine.

The monitoring program collects TSP, metals, $PM_{2.5}$, total dustfall, NO_2, and SO_2 ambient air quality data from two monitoring stations that were installed and commissioned in May 2015.

A summary of the Q4 2018 ambient air quality monitoring program results is provided below:

- There were 11 valid TSP samples collected at the Gallinger Road station, resulting in 73% sample validity. Metal and metalloid concentrations were measured on each of the TSP filters, with no exceedances of the 24-hour TSP AAQC in Q4 2018.
- There were 13 valid TSP samples collected at the Tait Road station, resulting in 87% sample validity. Metal and metalloid concentrations were measured on each of the TSP filters, with no exceedances of the 24-hour TSP AAQC in Q4 2018.
- There were 12 valid $PM_{2.5}$ samples collected at the Gallinger Road station, (80% valid data) and 15 valid samples collected at the Tait Road Station, (100% valid data), with no exceedances of the 24-hour AAQC or $PM_{2.5}$ CAAQS in Q4 2018.
- There were 3 valid dustfall samples collected at each of the Tait Road Station and Gallinger Road Station, resulting in 100% sample validity, with no exceedances of the 30-day dustfall AAQC in Q4 2018.
- There were 3 valid passive SO_2 and NO_2 samples collected at each of the two stations, resulting in 100% sample validity, and no exceedances of AEP Criterion for SO_2 or the 30-day equivalent AAQC for NO_2 in Q4 2018.

7.0 CLOSING

This *Rainy River Mine Ambient Air Quality Monitoring Program Fourth Quarter 2018 Report* was prepared by Wood for the sole benefit of New Gold Inc. for specific application to the Rainy River Mine. The quality of information, conclusions and estimates contained herein are consistent with the level of effort involved in Wood's services and based on:

i) information available at the time of preparation;

ii) data supplied by outside sources; and

iii) the assumptions, conditions and qualifications set forth in this document.

This report is intended to be used by New Gold only, and its nominated representatives, subject to the terms and conditions of its contract with Wood. Any other use of, or reliance on, this report by any third party is at that party's sole risk. This report has been prepared in accordance with generally accepted industry-standard practices. No other warranty, expressed or implied, is made.

If you require further information regarding the above or the Mine in general, please contact the undersigned at (905) 568-2929. Thank you for the opportunity to be of service to New Gold Inc.

Yours truly,

Wood Environment & Infrastructure Solutions
a Division of Wood Canada Limited

1 INTRODUCTION

1.1 Site Description

New Gold Inc. owns the Rainy River Mine (RRM), located in northwestern Ontario in the Township of Chapple and District of Rainy River, approximately 65 km northwest of Fort Frances, and approximately 420 km west of Thunder Bay (Figure 1.1). The RRM is located within the Pinewood River watershed. The Pinewood River flows past the RRM and drains into the Rainy River approximately 37 km downstream.

Earliest exploration of the RRM began in 1967. Rainy River Resources Ltd. acquired the project in 2005 and began conducting baseline studies in 2008. The RRM was acquired by New Gold Inc. in 2013 and an Environmental Assessment (EA) report was submitted in 2014 (AMEC 2014). Site construction began following provincial and federal EA approvals in 2015. In 2017, the RRM site construction was completed and the project transitioned to an operational mine which includes an open pit mine, ore storage facilities, a process plant, a Tailings Management Area (TMA), watercourse diversions, site drainage works, a fuel tank farm, explosives manufacturing facilities, explosives storage facilities, and plans for future underground operation. The Rainy River Mine was officially commissioned in September 2017.

Mine construction/operations have had only a moderate influence on surface water quality of the Pinewood River downstream of the RRM (Minnow 2018a). The influence of the RRM was evident in higher conductivity, hardness, calcium, potassium, and sodium in the Pinewood River downstream of the mine property relative to upstream (Minnow 2018a). No other analytes were significantly elevated in Pinewood River water downstream of effluent discharge compared to upstream while the effluent was discharging (September 2015 to December 2017; Minnow 2018a). However, RRM ceased effluent discharge in May 2018, and has no plans for effluent discharge until 2020 at earliest.

1.2 Project Background and Objective

The RRM fish tissue quality monitoring program is one part of RRM's comprehensive environmental monitoring activities and is a requirement of both the Federal EA Approval and provincial Environmental Compliance Approval (ECA). The ECA (Number 5178-9TUPD9) was issued by the Ministry of the Environment, Conservation, and Parks (MECP) on September 1, 2015. This requirement is comprised of two components, a large-bodied and a small-bodied fish tissue quality survey. The large-bodied fish survey is implemented on a three year cycle and the small-bodied fish survey is implemented annually. Due to logistical error, the large-bodied survey was implemented in 2018 and the small-bodied fish survey was not completed in 2018. The monitoring frequencies have been formalized and all stakeholders are

aware of the requirements for future surveys with the next large-bodied survey scheduled for 2021 and the small-bodied survey scheduled for 2019.

The objective of the large-bodied fish tissue quality monitoring is to characterize concentrations of contaminants of potential concern (COPCs; arsenic, boron, cadmium, cobalt, copper, chromium, iron, lead, manganese, mercury, molybdenum, nickel, selenium and zinc) in muscle, liver, and ovary tissues of two sentinel sport fish species, northern pike (*Esox lucius*) and walleye (*Sander vitreus*), collected in the Pinewood River downstream of historical effluent discharge. COPC concentration data are used to determine whether the RRM has affected these concentrations, and, if it has, to communicate any potential risk to human health from the consumption of the sentinel sport fish.

1.3 Study Design

The 2018 study included fish tissue quality assessment in the Pinewood River downstream of the RRM extending to approximately 500 m upstream of the confluence with the Rainy River. As required under ECA 5178-9TUPD9, tissue samples from fifteen individuals of two sentinel sport fish species, northern pike and walleye were collected. Three types of tissue were sampled: muscle, liver, and ovary. Data were compared to provincial, federal, and international criteria for the protection of human health (BCMOE 2012, Health Canada 2007, Health Canada 2010, MECP 2015, IRIS 2018) as well as to baseline concentrations (AMEC 2013).

2 METHODS

2.1 Overview

The RRM Fish Tissue Quality Monitoring Program was conducted from September 10th to 14th, 2018. The program focused on fish tissue quality assessment, targeting northern pike and walleye in the Pinewood River downstream of the RRM. All fish collection locations were recorded using a handheld Global Positioning System (GPS) and maps. The locations were chosen based on the results of previous fishing efforts, habitat characteristics preferred by the target species, and access.

2.2 Field Data Collection

Fish sampling was performed under an Ontario Ministry of Natural Resources and Forestry License to Collect Fish for Scientific Purposes (Licence No. 1090759; Appendix B). Fishing was conducted in the Pinewood River downstream of the RRM using gill nets and hoop nets (Figure 2.1). Gill nets were standard 100-ft lengths with mesh sizes of 3", 4", and 5". Medium hoop nets (0.75 m diameter hoops, 2.5 cm stretched mesh) were used. Time of deployment and retrieval were recorded for every net set. Upon retrieval of each net, captured fish were identified and counted, and results were recorded on catch data sheets. Only northern pike and walleye of edible size were retained for sampling (>30 cm total length, based on MECP recommendations for the Rainy River; MECP 2015). A total of fifteen northern pike and fifteen walleye were retained for detailed assessment. Any live bycatch[1] or additional target species captured were released.

All retained northern pike and walleye were measured to determine length (fork and total) and weight. Lengths were measured to the nearest millimetre on a fish board. Weights were measured to the nearest 1 to 5% of total weight using Pesola™ spring scales. Two aging structures (scales and either cleithra [northern pike] or dorsal spines [walleye]) were collected from each sacrificed fish. Livers and gonads (if developed) were removed using clean implements (cutting boards, fillet knives, and tweezers) and weighed to the nearest 0.001 g (with ± 1% precision) using a Scout Pro balance. Tissue samples of boneless, skinless muscle tissue, whole livers, and whole ovaries (where present and developed) were collected from each fish, placed in clean, labeled Whirl-Pak™ bags, and frozen until analysis.

Upon completion of the sampling program, tissue samples were submitted to ALS Environmental in Thunder Bay, Ontario, along with a chain-of-custody record, a list of expected Lowest Detection Limits (LDLs), and laboratory QA/QC requirements (Appendix A). Aging structures were shipped

[1] Unwanted fish species caught while conducting targeted sampling for a different species (i.e., in this study, any fish species other than northern pike and walleye).

to AAE Tech Services Inc. in Winnipeg, Manitoba, along with a chain-of-custody record for determination of fish ages.

2.3 Analysis of Catch and Meristic Data

Fish catch data were compiled and summarized. The catch compilations, along with data on the gill net and hoop net set durations were used to calculate total and species-specific catch-per-unit effort (CPUE) for each capture method in the Pinewood River.

2.4 Analysis of Chemical Data

Upon receipt of the chemical data from ALS, a data quality review (DQR) was performed. This included the assessment of laboratory precision and laboratory accuracy against data quality objectives (DQOs) established at the outset of the project (Appendix A). A minimum of 10% of the analyses represented quality control samples (e.g., laboratory duplicates and certified reference materials). After DQR, summary statistics were calculated for each analyte (i.e., mean, standard deviation, minimum, and maximum).

Mercury is the only metal[2] for which a commercial guideline and various consumption level advisories have been established for fish muscle tissue (Health Canada 2007, BCMOE 2012, MECP 2015). Health Canada has established a standard of 0.5 mg/kg wet weight (ww) as the maximum acceptable concentration of mercury in commercially sold fish, enforceable by the Canadian Food Inspection Agency (Health Canada 2007). Although this guideline is only applicable to commercially sold fish, 0.5 mg/kg ww is also the level at which the MOECP recommends a complete consumption restriction for vulnerable populations (i.e., women of child-bearing age and children under 15; Table 2.1; MECP 2015). In addition to evaluating mercury concentrations relative to health guidelines, relationships between mercury concentrations in fish muscle tissue and age were explored graphically. Mercury concentrations were also compared to previous studies including baseline data collected in 2012 (AMEC 2013).

Summary statistics were calculated for each parameter by year. Summary statistics included sample size, mean, standard deviation, minimum, and maximum values. Means and standard deviations were estimated used the Kaplan-Meier (K-M) method to most appropriately deal with less than laboratory reporting limit data (Helsel 2012). This method involves transforming left-censored data (i.e., data prefaced with a "<" symbol) to right-censored data (i.e., values prefaced with a ">" symbol), and then using the K-M estimator (used to estimate the mean survival time in survival analysis) to estimate the mean. The calculation was completed using the survfit() function in the survival package (Therneau 2017) in R software (R Core Team 2019) and involves

[2] Here and elsewhere in this document, "metal" includes metalloids, such as arsenic and selenium.

Table 2.1: Fish Consumption Advisories for Vulnerable Populations and for the General Population Based on Fish Tissue Mercury Concentrations (MECP 2015)

Advisory recommended maximum number of meals per month	Fish tissue mercury concentration (mg/kg w.w.)	
	As consumed by vulnerable populations [a]	As consumed by the general population
32	0	0
16	0.06	0.15
12	0.12	0.3
8	0.16	0.4
4	0.25	0.6
2	-	1.2
0	0.5	1.8

[a] i.e., women of child-bearing age and children under 15.
Note: w.w. - wet weight.

calculating the area under the K-M survival curve. The K-M method is non-parametric and can accommodate multiple laboratory reporting limits (LRLs). This method of estimating the mean is equivalent to using the distribution of detected values below the maximum LRL to represent values that are <LRL. For example, the mean of the data set {1, 2, <4, 5} is estimated as the mean of 1, 2, [½×1 + ½×2], and 5 which is 2.375. The value <4 is replaced by the distribution of values below 4 (i.e. 1 and 2 with equal weight of ½). Similarly, the mean of the data set {1, 1.6, 2, 2.1, <4, 5} is estimated as the mean of 1, 1.6, 2, 2.1, [¼×1 + ¼×1.6 + ¼×2 + ¼×2.1], and 5 which is 2.229. Again, the value <4 is replaced by the distribution of values below 4 (i.e., 1, 1.6, 2, and 2.1 with equal weight of ¼). If the minimum value in the data set is <LRL then it is replaced with the LRL. Therefore, if there is only one LRL and no detected values <LRL, then the K-M estimate of the mean is equivalent to replacing the value <LRL with the LRL (i.e., the best guess for the values <LRL is the LRL). If a standard deviation could not be estimated (e.g., all data <LRL), then one was not reported.

Concentrations of mercury in muscle, liver, and ovary tissue of northern pike and walleye were plotted versus fork length by species and year using scatterplots because mercury is known to bio-accumulate in fish tissue over time (e.g. Evers et al. 2011, Kidd and Batchelar 2012). Concentrations of mercury in muscle were plotted relative to the Health Canada guideline (Health Canada 2007) of 0.5 mg/kg ww. Statistical comparisons of concentrations of mercury among years (2012, 2015, 2016, 2017, and 2018) were conducted by species using analysis of

covariance (ANCOVA) with fork length as the covariate. An assumption of ANCOVA is that the range of covariate values (i.e., fork length) is similar among groups. The range of fork lengths was therefore truncated for statistical comparisons to provide a similar range of fish sizes among years and to remove the influence of small fish observed in 2012 (northern pike) and 2016 (walleye) on the regression coefficients. For northern pike, comparisons to 2012 were made on fish between 40 and 55 cm fork length, and comparisons among the other years (excluding 2012) were made on fish between 40 and 70 cm. For walleye, comparisons to 2016 were made on fish between 30 and 40 cm fork length, and comparisons among the other years (excluding 2016) were made on fish greater than 30 cm fork length. Fork length and concentrations of mercury were $\log_{10}$-transformed to meet the assumptions of normality of the model residuals.

The ANCOVA analyses were conducted using all data and then supported by comparisons of similar sized fish among years. The first step was to test the significance of the interaction between year and fork length in the ANCOVA interaction model (i.e., a test for equal regression slopes among years). If the regression slopes were significantly different, pairwise comparisons of slopes were conducted among years. In most cases, significant differences among slopes were driven by the range of fish sizes among years and the ANCOVA analyses proceeded on a subset of size or on two subsets of sizes as described above. For the subset analyses, when significantly different regression slopes were observed among years, the conclusion was that there is a difference among years in mean mercury concentration but the magnitude depends on the size of the fish. The magnitude of difference in mercury concentration among years was estimated based on the predicted means from the regression equations at the minimum and maximum values of the range of fork lengths that overlap among years.

For ANCOVA models with similar slopes, the ANCOVA parallel slope model was fit (i.e., the non-significant interaction term was dropped from the model). If fork length was not a significant predictor of mercury concentration in the ANCOVA parallel slope model, mercury concentration was compared among years using an ANOVA with post-hoc comparisons of least-squares means and Tukey's honestly significant differences method for multiple comparisons. If fork length was a significant predictor of mercury concentration in the ANCOVA parallel slope model, the differences in concentrations of mercury among years were assessed with post-hoc comparisons of least-squares means at the average fork length and Tukey's honestly significant differences method for multiple comparisons.

A meaningful ANCOVA analysis of ovary mercury concentrations versus size could not be conducted because too few of the walleye captured in 2018 were mature females and the range of fork lengths of those that were captured were not similar to previous years. Concentrations of mercury in ovary were therefore compared using a Kruskal-Wallis test on concentration between

years, with Dunn's test for pairwise differences. No adjustment was made for multiple comparisons because of the low power of non-parametric tests.

Significant differences were evaluated among years using a compact letter system. Capital letters were assigned to years (e.g., A,B,C) and lower case letters to slopes (e.g. a,b,c) such that years that share a letter are not significantly different. The letters were assigned such that the year with the highest mean (or slope) was assigned the letter "A" (or "a").

A magnitude of difference was calculated relative to the baseline year (defined as the minimum year used in the statistical comparison) as:

$$\text{Magnitude of Difference } \frac{\bar{x}_{\text{i}} - \bar{x}_{\text{baseline}}}{\bar{x}_{\text{baseline}}} \times 100\% ,$$

where $\bar{x}_i$ is the mean for year *i* , $\bar{x}_{baseline}$ is the mean for the baseline year. The magnitude of difference was calculated using length-adjusted means for ANCOVA with parallel slopes, predicted means from regressions by year for the ANCOVA with significantly different slopes, geometric means for the ANOVA, and medians for the Kruskal-Wallis test. All statistical comparisons were conducted using a significance level (α) of 0.05, in R 3.5.0 (R Core Team 2019) using custom functions and the R package emmeans 1.2.1 (Lenth 2018).

Concentrations of selenium in muscle of northern pike and walleye were plotted versus fork length by species and year using scatterplots and relative to the British Columbia Ministry of Environment (BCMOE) consumption guidelines. These guidelines were 1.8 mg/kg ww for a high intake diet and 3.6 mg/kg ww for a moderate intake diet (BCMOE 2012).

Concentrations of other metals in muscle, liver, and ovary tissue were evaluated relative to consumption benchmarks (Table 2.2). These benchmarks were derived based on the lowest reported tolerable daily intake (TDI; Health Canada 2010, IRIS 2018) and established consumption rates for fish eating populations (OHM 1990, Richardson 1997, USEPA 1997, Health Canada 2010), assuming a typical adult body weight of 70 kg, where:

Fish Consumption Limit Benchmark = TDI mg/kg x 70 kg / consumption rate (kg).

Investigations during the initial environmental assessment (EA) determined that the RRM area does not support a significant commercial or recreational fishery and that no traditional activities are currently undertaken within the RRM area by local First Nation and/or Métis people (AMEC 2014). Further discussion with local First Nations community members in August 2016 confirmed that the Pinewood River does not support a significant traditional fishery, and that it is only occasionally used for recreational fishing, with most fishing located near the mouth (Minnow 2017). In light of this, the consumption rate category of 21.8 g/d was used in deriving

Table 2.2: Consumption Benchmarks for Metals (including all COPCs) in Fish Tissue (mg/kg)

Analyte	Tolerable Daily Intake (mg/kg day)[a]	Fish Concentration Benchmarks (mg/kg) Based on		
		6.5 g/day[b]	21.8 g/day[c]	111 g/day[d]

Selected benchmark.

Note: COPC - Contaminants of Potential Concern.

[a] Where values were reported by both IRIS (2018) and Health Canada (2010), the lowest value was used to derive a conservative benchmark.

[b] USEPA (1997) mean consumption rate for general population; mean value for anglers is 8.0 g/day, 95th percentile for anglers is 25 g/day.

[c] Upper limit consumption rate for Canadian population based on high caloric intake (OHM 1990). Also the highest consumption level considered in development of fish advisories in Ontario.

[d] Health Canada (2010) consumption rate for screening level risk assessments, from Richardson (1997). Exceeds the average value for fishing subsistence populations (70 g/day; USEPA 1997).

[e] IRIS (2018).

[f] Health Canada (2010).

[g] Based on nickel chloride.

[h] Most conservative concentration (tolerable daily intakes are defined on an age-group specific basis).

the benchmarks, representing the upper limit consumption rate for Canadian population based on high caloric intake (Table 2.2; OHM 1990, Richardson 1997).

The consumption rate of 21.8 g/d still results in the derivation of conservative benchmarks, as it is more than double the mean consumption rate for anglers within a general population (8.0 g/d; USEPA 1997). Additionally, 21.8 g/d is the highest consumption level considered in development of fish advisories in Ontario. Benchmarks were derived for COPC for which health criteria or TDI values were available (Table 2.2): antimony, arsenic, barium, beryllium, boron, cadmium, chromium, copper, lead, manganese, molybdenum, nickel, silver, strontium, uranium, and zinc. Of the COPCs, only cobalt and iron do not have applicable health criteria or TDI values (i.e., benchmarks could not be calculated), so concentrations in fish tissues recorded in 2018 were only compared to baseline data.

3 RESULTS

3.1 Fish Communities and Catch-per-unit-effort

A total of seven fish species were captured in the Pinewood River using gill nets and hoop nets (Table 3.1). Walleye were the most abundant large bodied fish, followed by northern pike and black crappie (Table 3.1). Catch-per-unit-effort in 2018 was similar to previous years.

3.2 Northern Pike Tissue Quality

3.2.1 Muscle Tissue Chemistry

Up until May 2018 (when RRM ceased effluent discharge), there had been no detectable mercury concentrations in effluent and receiving water quality samples (Minnow 2018a), suggesting that effluent may not meaningfully contribute to mercury accumulation in Pinewood River fish. Naturally elevated mercury concentrations are often observed in predatory fish species in northern lakes and depositional rivers due to naturally elevated environmental mercury levels, atmospheric deposition of mercury, and biogeochemical conditions that favour mercury methylation (Evers et al. 2011, Kidd and Batchelar 2012). Methylated mercury is biomagnified through the food chain resulting in elevated concentrations in predatory fish species such as northern pike and walleye (Evers et al. 2011, Kidd and Batchelar 2012). In addition to this, methylated mercury has a long residence time in tissues and, with continued exposure, will bioaccumulate over the organism's lifetime (Evers et al. 2011, Kidd and Batchelar 2012). Bioaccumulation in northern pike in the Pinewood River is characterized by the relationship between mercury concentration in muscle tissue and fish size (i.e., fork length) and age (Figures 3.1 and 3.2; Appendix Table B.3).

Northern pike muscle tissue collected in 2018 contained an average mercury concentration below all consumption guidelines (Table 3.2). However, six large fish (ranging in size from 56.1 and 63.9 fork length) had mercury concentrations above consumption guidelines for vulnerable populations (0.5 mg/kg; Figures 3.1 and 3.2; Appendix Table C.5). Despite these exceptions, all mercury concentrations in muscle tissue were well below the complete consumption restriction level for the general population (1.8 mg/kg; Table 2.1, Figures 3.1 and 3.2; MECP 2015). All other metal concentrations in muscle tissue were below established guidelines (established in Section 2.4), including selenium concentrations that were much lower than British Columbia's consumption guidelines (Figure 3.3; BCMOE 2012).

The 2018 mercury concentrations in muscle were compared to 2017, 2016, 2015, and baseline data (2012). The assessment was made by comparing concentrations at length, due to the established relationship between mercury concentrations and fish size (Figures 3.1 and 3.2).

Table 3.1: Summary of Fishing Effort in the Pinewood River, Rainy River Mine Fish Monitoring, 2018

a) Fish catch numbers by sampling method.

Size Class	Species	Gill Nets	Hoop Nets	Total Catch
Large Body	Northern Pike	35	0	35
	Walleye	38	3	41
	Black Crappie	14	13	27
	Brown Bullhead	0	1	1
	Shorthead Redhorse	1	0	1
	White Sucker	0	2	2
	Yellow Perch	0	3	3

b) Catch-per-unit-effort (CPUE) by sampling method.

Size Class	Species	Gill Nets (fish per 100 m*hr)[a]	Hoop Nets (fish per trap*day)[b]
Large Body	Northern Pike	0.54	0.00
	Walleye	0.59	0.40
	Black Crappie	0.22	1.75
	Brown Bullhead	0.00	0.13
	Shorthead Redhorse	0.02	0.00
	White Sucker	0.00	0.27
	Yellow Perch	0.00	0.40
Total CPUE		1.36	2.95

[a] total effort = 64.7 (length*hours/100 m)
[b] total effort = 7.4 (trap * days)

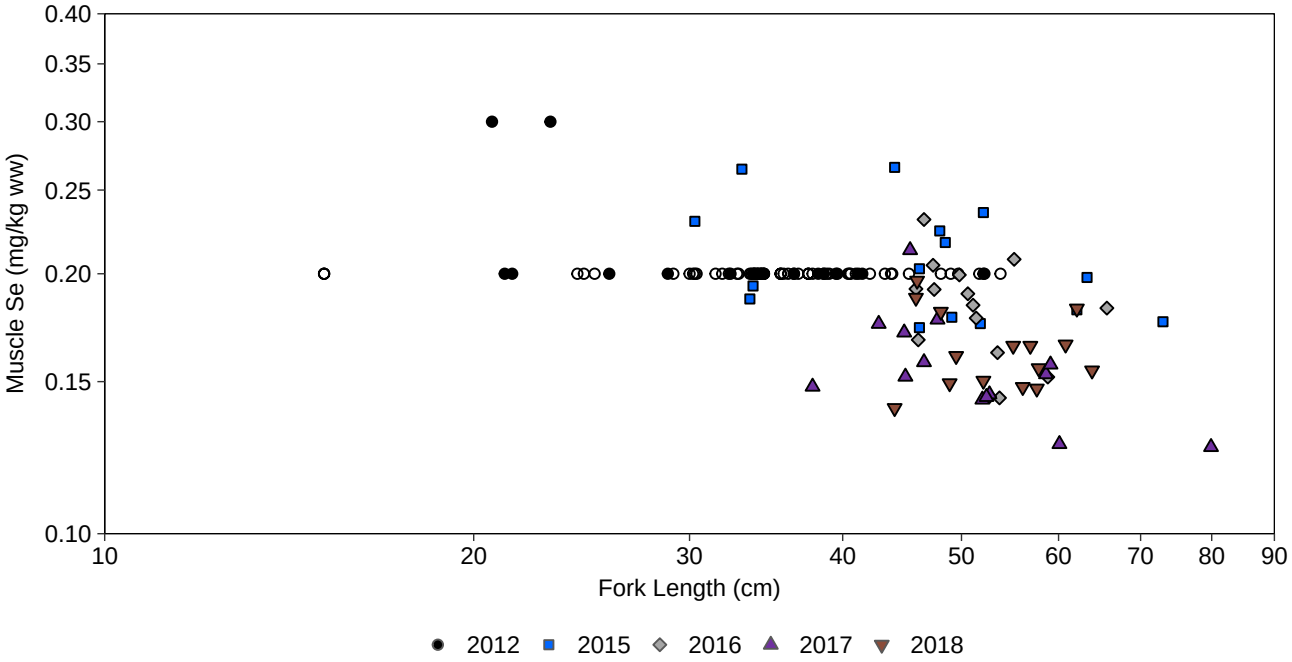

Figure 3.3: Scatterplot of Concentrations of Selenium (Se) in Muscle of Northern Pike from Pinewood River, 2012 to 2018

Notes:
Concentrations below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. BCMOE Guideline = 1.8 mg/kg ww (high intake) and 3.6 mg/kg ww (moderate intake).

Comparison with previous data showed that mercury concentrations in muscle have generally remained within the same range or lower, despite notably different maximum sizes/ages (Figure 3.1 and Table 3.3; AMEC 2013). Metal concentrations in northern pike muscle tissue in 2018 were within the range of baseline (2012), 2015, 2016, and 2017 concentrations (Table 3.3; AMEC 2013).

The relationship between mercury concentrations in muscle and length were compared statistically among baseline (2012) and the four Fish Tissue Monitoring Programs (2015, 2016, 2017, and 2018; Table 3.4). Mercury concentrations in muscle did not differ significantly among 2012, 2015, 2016, 2017, and 2018 fish (Table 3.4; Figure 3.1).

3.2.2 Liver and Ovary Tissue Chemistry

Fish liver tissue is not recommended for human consumption (MECP 2015). Discussion with local First Nations community members in August 2016 indicated that organs of fish caught in the Pinewood River are not regularly eaten by community members (Minnow 2017). It is unclear whether livers are included with canned northern pike, a process which includes 80% of the fish (Minnow 2017). However, since RRM has regulatory requirements to monitor for key contaminants in northern pike and walleye livers, concentrations of metals in livers were screened against benchmarks to provide perspective on whether this tissue is edible based on chemical quality. Many metals are known to accumulate to higher concentrations in liver tissue than in muscle tissue (e.g., chromium, lead), and liver is more likely to contain quantifiable chemical concentrations (AMEC 2013).

Northern pike liver tissue collected in 2018 contained an average mercury concentration that was well below human consumption benchmarks, however, two individual fish had liver mercury concentrations above consumption guidelines for vulnerable populations (0.5 mg/kg; Table 3.5; Appendix Table C.6). All other metal concentrations in liver tissue were below associated guidelines (Appendix Table C.6). Compared temporally, 2018 metal concentrations in liver were within the range of data from previous studies (2012, 2015, 2016, and 2017) for all metals (Table 3.6; AMEC 2013).

Similar to muscle, mercury concentrations in liver were compared statistically among the 2012, 2015, 2016, and 2018 data. As with muscle, liver mercury concentrations in 2018 were not statistically different than baseline (2012; Table 3.4; Figure 3.1). Additionally, 2018 mercury concentrations in liver were similar to those in 2015 and 2017, but greater than those in 2016 (Table 3.4).

Discussion with local First Nations community members in August 2016 indicated that roe of fish caught in the Pinewood River is not regularly eaten by community members (Minnow 2017).

Table 3.3: Concentrations (mean ± standard deviation) of Contaminants of Potential Concern (COPCs) in Northern Pike Muscle Tissue, Comparing Baseline (2012) and Construction/Operations (2015, 2016, 2017, 2018) Data, Rainy River Mine Fish Tissue Quality Monitoring

P-value < 0.05
Covariate P-value > 0.05 (i.e., fork length is not a significant predictor of Hg concentration)
Year is significantly > baseline year
Year is significantly < baseline year

Notes:
[a] Covariate value that corresponds to the adjusted means or predicted means in the ANCOVA.
[b] Mean reported for t-test; length-adjusted mean or predicted mean reported for ANCOVA, median reported for Mann-Whitney test.
[c] Years that share a letter (A,B,C) are not significantly different (Tukey's honestly significant differences method; α = 0.05); Slopes that share a letter (a,b) are not significantly different (all pairwise comparisons of slopes; α = 0.05).
[d] Range of fork lengths that provides good overlap of fish sizes to compare 2018 to 2012.
[e] Range of fork lengths that provides good overlap of fish sizes to compare 2018 to 2015, 2016, and 2017.
[f] Baseline year denotes measurements prior to mine operatration, (i.e. 2012), for endpoints not collected during this time period (i.e. ovary tissue), baseline denotes the earliest year in the temporal comparisons.

[b] See Table 2.2 for Consumption Benchmark References.

Despite this, concentrations of metals in ovaries were screened against benchmarks to provide perspective on whether this tissue would be safe to eat based on chemical quality. Some metals are known to accumulate to higher concentrations in ovary tissue than in muscle tissue (e.g., selenium; Janz 2012).

Screening of 2018 ovary tissue results showed that ovaries contained metal concentrations that were below human consumption benchmarks for metals with established TDI values or a provincial/commercial guideline (Table 3.7; Appendix Table C.7). Average ovary concentrations of northern pike collected in 2018 were within the range of fish collected in 2015 and 2016 for all metals (Table 3.8).

As with muscle and liver, mercury concentrations in ovary tissue were compared statistically among the four Fish Tissue Monitoring Programs[3] (2015, 2016, 2017, and 2018). Mercury concentrations in ovary tissue in 2018 were significantly higher than in 2015, 2016, and 2017, (Table 3.4, Figure 3.1). This relationship cannot be explained by fish size or age, and should be monitored moving forward. It should be noted that this relationship was not observed in muscle or liver tissue where it would normally be expected (Evers et al. 2011, Kidd and Batchelar 2012), thereby making these findings equivocal.

3.3 Walleye Tissue Quality

3.3.1 Muscle Tissue Chemistry

Average mercury concentrations in walleye muscle for 2018 were below human consumption benchmarks, however two large individuals were above consumption guidelines for vulnerable populations (0.5 mg/kg; Table 3.9; Appendix Table C.5). Despite these higher mercury concentrations, all walleye muscle tissue were well below the complete consumption restriction level for the general population (1.8 mg/kg; Table 2.1, Figure 3.4; MECP 2015). Walleye muscle metal concentrations for all other metals were below associated guidelines (Appendix Table C.5). Metal concentrations in 2018 walleye muscle tissue were within the range of data for all previous studies (Table 3.10; AMEC 2013). Additionally, selenium concentrations in walleye muscle tissue were much lower than British Columbia's consumption guidelines (Figure 3.5; BCMOE 2012).

The 2018 mercury concentrations in muscle were compared to previous data (2017 and 2016; Figure 3.4). Similar to northern pike, the assessment was made by comparing concentrations at length. Comparison with previous data showed that concentrations have generally remained within the same range, despite notably different maximum sizes/ages (Figures 3.2 and 3.4; AMEC 2013). As with northern pike, the longest/oldest walleye captured in the 2018 study was

[3] Ovary tissue was not collected in 2012.

[b] See Table 2.2 for Consumption Benchmark References.

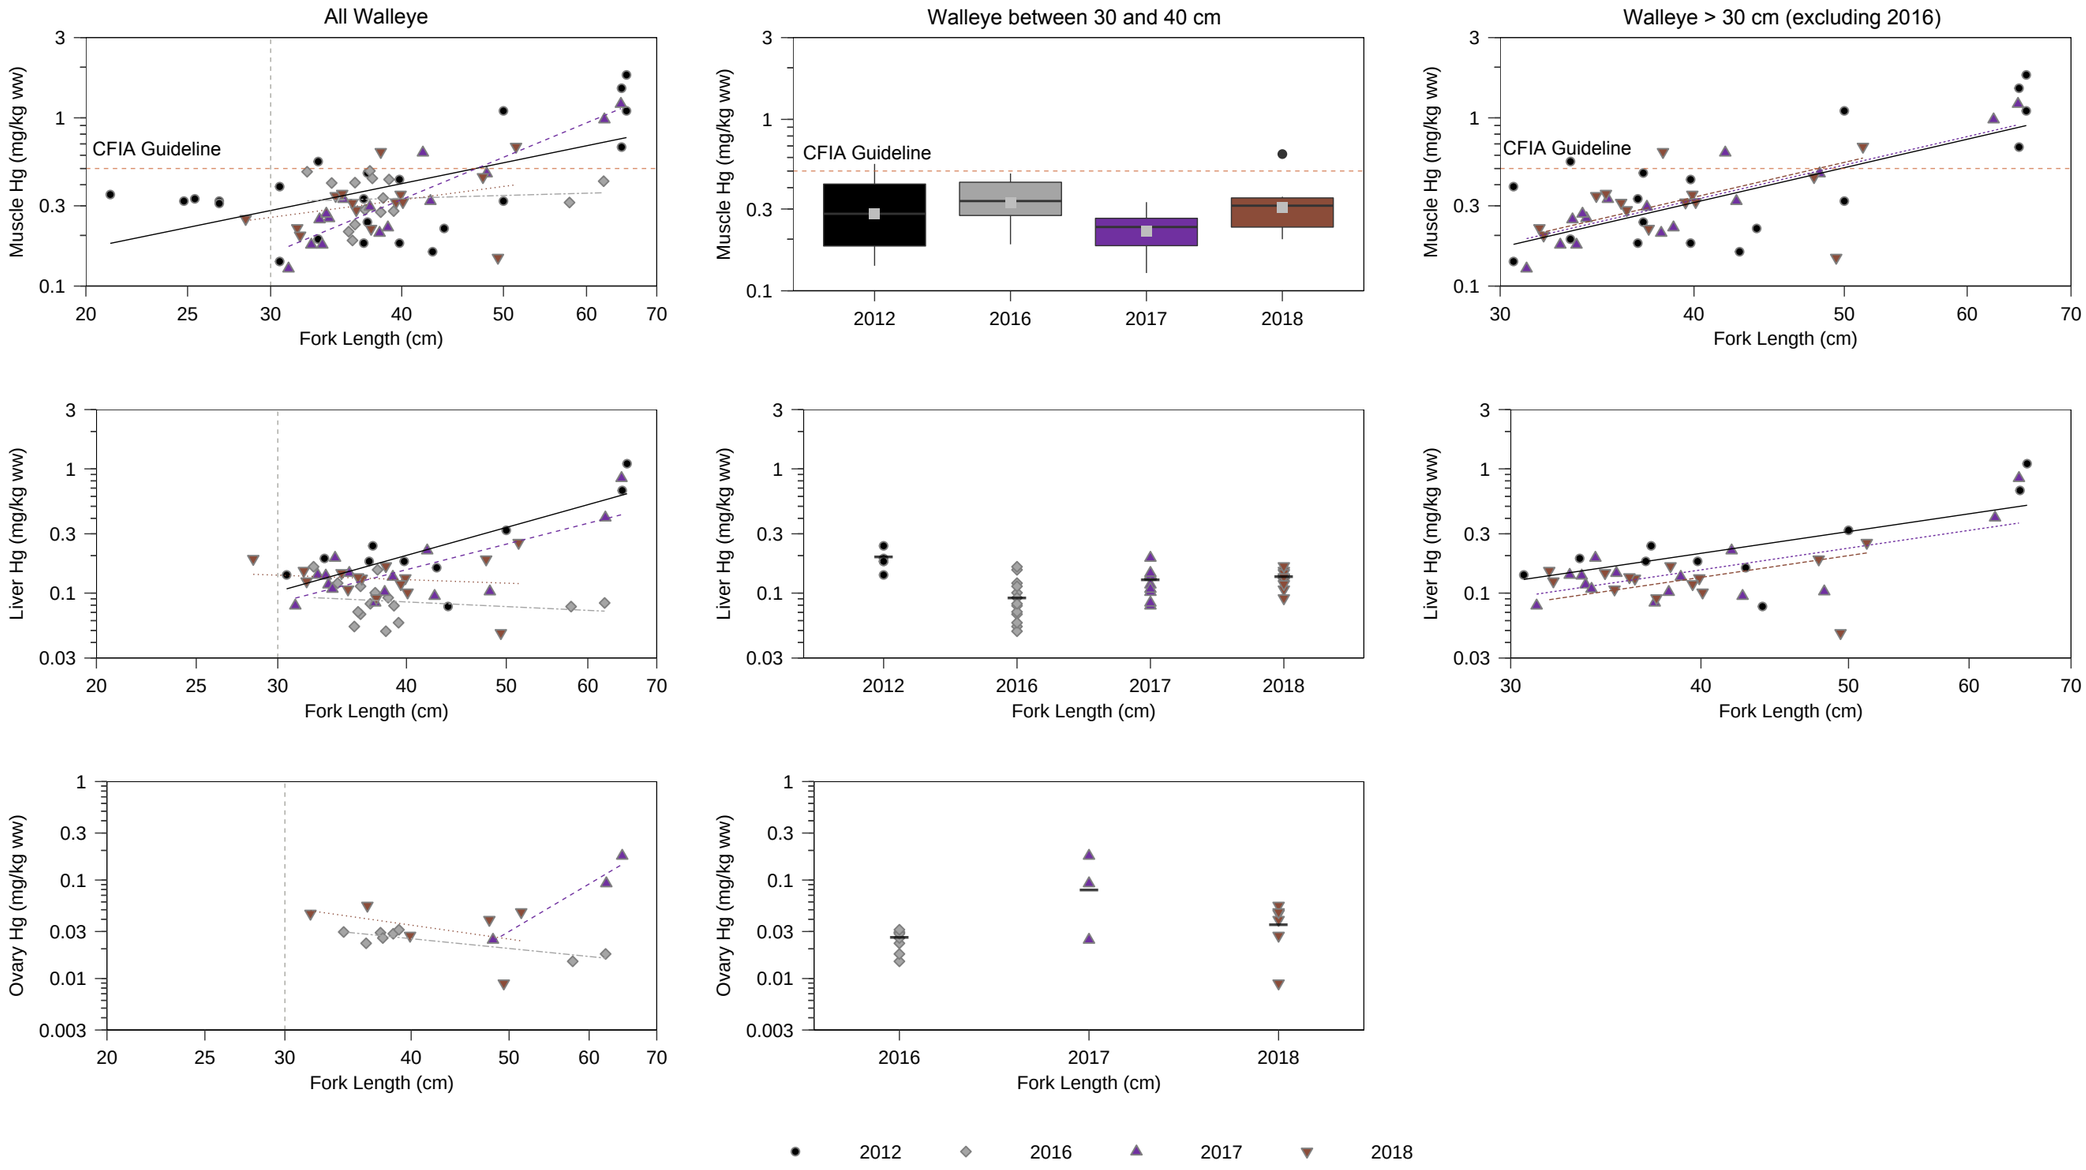

Figure 3.4: Scatterplots, Boxplots, or Individual Value Plots of Concentrations of Mercury (Hg) in Muscle, Liver, and Ovary of Walleye from Pinewood River, 2012 to 2018

Notes:
Left: All data; Middle: Fish between 30 and 40 cm used in ANOVA or Kruskal-Wallis comparisons; Right: Fish > 30 cm and excluding 2016, fit to ANCOVA parallel slope model
Boxplots: box represents the first quartile (Q1), the median, and Q3. Whiskers extend to the minimum and maximum values; however, values above Q3 + 1.5IQR or below Q1 − 1.5IQR are plotted as individual points (IQR = Q3 − Q1) and the whiskers are truncated to the next value in the dataset. The mean is plotted as a square.
Dashed horizonal line = CFIA Guidleine of 0.5 mg/kg ww
Dashed vertical line = cut off used for examining similar sized fish among years

Table 3.10: Concentrations (mean ± standard deviation) of Contaminants of Potential Concern (COPCs) in Walleye Muscle Tissue, Comparing Baseline (2012) and Construction/Operations (2015, 2016, 2017, 2018) Data, Rainy River Mine Fish Tissue Quality Monitoring

[b] See Table 2.2 for Consumption Benchmark References.

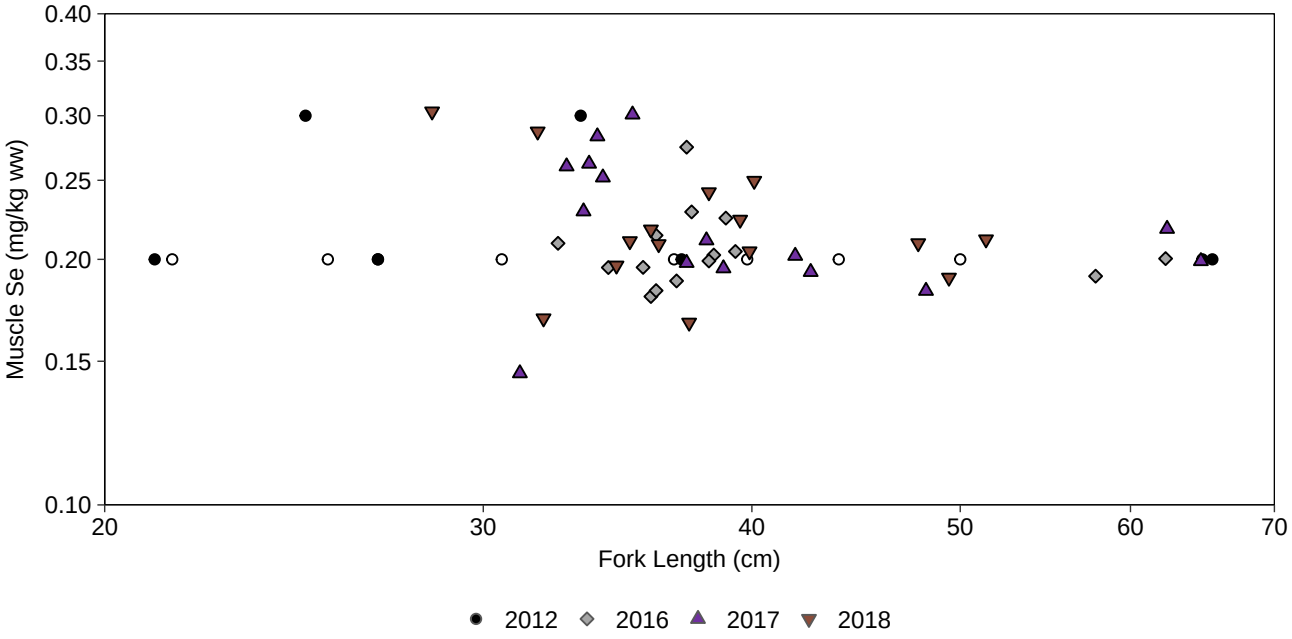

Figure 3.5: Scatterplot of Concentrations of Selenium (Se) in Muscle of Walleye from Pinewood River, 2012 to 2018

Notes:
Concentrations below the laboratory reporting limit (LRL) are plotted as open symbols at the LRL. BCMOE Guideline = 1.8 mg/kg ww (high intake) and 3.6 mg/kg ww (moderate intake).

within the range of fish captured during previous studies (2012, 2016, and 2017). As with northern pike, walleye muscle tissue mercury concentrations generally increased with increasing fish size (Figures 3.2 and 3.4; Appendix Table B.4).

The relationship between mercury concentrations in muscle and length were compared statistically among baseline data (2012) and the three subsequent years of monitoring[4] (2016, 2017, and 2018; Table 3.11). Mercury concentrations in walleye muscle tissue were similar between 2018 and baseline (Table 3.11, Figure 3.4). The relationship between muscle tissue mercury concentration and walleye size was notably different in 2016 than in 2018, 2017, and baseline, with no apparent increase in concentrations with size evident in 2016 (Figure 3.4). Examination of the data plots suggests similar mercury concentrations among years in smaller fish, but lower concentrations in larger fish in 2016 (leveraged by two large fish Figure 3.4).

3.3.2 Liver and Ovary Tissue Chemistry

Average 2018 liver tissue metal concentrations were below human consumption benchmarks for metals with established TDI values or commercial/provincial guidelines (Table 3.12, Appendix Tables B.4 and C.6). As with muscle, metal concentrations in liver for 2018 were within the range of 2017, 2016, and baseline (2012) data for all metals (Table 3.13; AMEC 2013).

Similar to northern pike, mercury concentrations in liver tissue were compared statistically among the three years of monitoring (2016, 2017, and 2018) and baseline (2012). Mercury concentrations in 2018 were statistically similar to those in baseline and 2017 but were significantly higher than 2016 (Table 3.11; Figure 3.4). As with walleye muscle, there was no apparent relationship between liver mercury concentration and fish size in 2016 (Figure 3.4).

Screening of 2018 ovary tissue results showed that ovaries contained average metal concentrations that were below human consumption benchmarks for metals with established TDI values or a provincial/commercial guideline (Table 3.14; Appendix Table C.7). Metal concentrations in walleye ovary tissue collected in 2018 were within the range of concentrations reported in previous studies for all metals (Table 3.15).

As with muscle and liver, mercury concentrations in ovaries were compared statistically among the three Fish Tissue Monitoring Programs (2016, 2017, and 2018). Mercury concentrations in ovary tissue did not differ significantly among 2018, 2017, and 2016 fish (Table 3.11, Figure 3.4).

[4] Only one walleye (male) was captured during the 2015 field survey, and therefore could not be compared statistically.

Table 3.11: Results of Statistical Comparisons of Concentrations of Mercury in Muscle, Liver, and Ovary of Walleye from Pinewood River, 2012 to 2018

P-value < 0.05
Covariate P-value > 0.05 (i.e., fork length is not a significant predictor of Hg concentration)
Year is significantly > baseline year
Year is significantly < baseline year

Notes:

[a] Covariate value that corresponds to the adjusted means or predicted means in the ANCOVA.

[b] Mean reported for t-test; length-adjusted mean or predicted mean reported for ANCOVA, median reported for Mann-Whitney test.

[c] Years that share a letter (A,B,C) are not significantly different (Tukey's honestly significant differences method; α = 0.05); Slopes that share a letter (a,b) are not significantly different (all pairwise comparisons of slopes; α = 0.05).

[d] Range of fork lengths that provides good overlap of fish sizes to compare 2018 to 2016.

[e] Range of fork lengths that provides good overlap of fish sizes to compare 2018 to 2012 and 2017.

[f] Range of fork lengths that provides good overlap of fish sizes to compare 2018 to all other years.

[g] Baseline year denotes measurements prior to mine operatration, (i.e. 2012), for endpoints not collected during this time period (i.e. ovary tissue), baseline denotes the earliest year in the temporal comparisons.

4 CONCLUSIONS AND RECOMMENDATIONS

4.1 Conclusions

Conclusions of the fish assessment undertaken in the Pinewood River downstream of the Rainy River Mine in the fall of 2018 are listed below.

1. Fish communities and catchability (CPUE) were generally consistent with the results of previous sampling efforts, with higher CPUE for northern pike relative to walleye. CPUE for northern pike and walleye were similar to previous years.

2. Northern pike and walleye mean muscle, liver, and ovary tissue samples contained metal concentrations that were below available human consumption benchmarks and within the range of baseline for tissue concentrations. However, although mean mercury concentrations were below benchmarks, mercury concentrations in six northern pike and two walleye muscle samples, and in one northern pike liver tissue sample exceeded some consumption guidelines. This was associated with the large size of these fish. Mercury concentrations in tissue of larger predatory fish are often naturally high in northern environments (Evers et al. 2011) and these results do not indicate that the RRM has influenced fish tissue quality. Based on comparisons to human consumption benchmarks and baseline data, it appears that the RRM has not influenced metal concentrations in muscle tissues of exposed northern pike or walleye.

3. Statistical analysis of northern pike and walleye muscle, liver, and ovary tissue mercury concentrations as related to length compared among the 2012, 2015, 2016, and 2017 Fish Tissue Monitoring Studies show no major temporal trends. Notably, there is a slight increase of northern pike liver and ovary concentrations over time, however these concentrations are below the consumption guideline, and this trend is not seen in muscle mercury concentrations.

Overall, the data indicate that the Rainy River Mine has not influenced the concentrations of metals in muscle, liver, and ovary tissues of sentinel fish species (northern pike and walleye).

4.2 Recommendations

Based on information acquired during the 2018 fish tissue monitoring study, recommendations for future monitoring include:

1. Continued monitoring of metal concentrations in muscle, liver, and ovary tissues for both sentinel species. This will allow for consistent year to year comparisons.

2. Provide notification to solicit possible public participation in the collection of northern pike and walleye by angling (fall 2021), to foster community engagement.

A1 INTRODUCTION

A1.1 Overview

The Data Quality Review (DQR) assessed data collected as part of the Rainy River Project 2018 Fish Tissue Quality Report. The DQR covers data collected in 2018. The objective of the DQR is to define the overall quality of the data presented in the report, and, by extension, the confidence with which the data can be used to derive conclusions.

A1.2 Background

A variety of factors can influence the chemical and biological measurements made in an environmental study and thus affect the accuracy and/or precision of the data. Inconsistencies in sampling or laboratory methods, use of instruments that are inadequately calibrated or which cannot measure to the desired level of accuracy or precision, and contamination of samples in the field or laboratory are just some of the potential factors that can lead to the reporting of data that do not accurately reflect actual environmental conditions. Depending on the magnitude of the problem, inaccuracy or imprecision have the potential to affect the reliability of any conclusions made from the data. Therefore, it is important to ensure that monitoring programs incorporate appropriate steps to control the non-natural sources of data variability (i.e., minimize the variability that does not reflect natural spatial and temporal variability in the environment) and thus assure the quality of the data.

Data quality as a concept is meaningful only when it relates to the intended use of the data. That is, one must know the context in which the data will be interpreted in order to establish a relevant basis for judging whether or not the data set is adequate. The DQR involves comparison of actual field and laboratory measurement performance to data quality objectives (DQOs) established for a particular study, such as evaluation of method detection limits, blank sample data, data precision (based on laboratory duplicate samples), and data accuracy (based on matrix spike recoveries and/or analysis of standards or certified reference materials).

DQOs were established either at the outset of the field program or by the laboratory and reflect reasonable and achievable performance expectations. The lowest detection limit (LDL) was set at the outset of the field program for tissue quality. Only samples that were below the laboratory detection limits were evaluated against target detection limits. Target detection limits should be at least as low as applicable guidelines, ideally ≤ 1/10th guideline values. Programs involving a large amount of samples and analytes usually result in some analytes that exceed the DQOs. This is particularly so for multi-element scans (e.g., ICP scans for

metals) since the analytical conditions are not necessarily optimal for every element included in the scan. Generally, scan results may be considered acceptable if no more than 20% of the parameters fail to meet the DQOs. Overall, the intent of comparing data to DQOs was not to reject any measurement that did not meet the DQO, but to ensure that any questionable data received more scrutiny to determine what effect, if any, this had on interpretation of results within the context of this project.

A1.3 Types of Quality Control Samples

Several types of quality control (QC) samples were assessed based on samples collected (or prepared) in the field and laboratory. These samples, and a description of each, include the following:

- **Blanks** are samples of de-ionized water and/or appropriate reagent(s) that are handled and analyzed the same way as regular samples. These samples will reflect any contamination that occurred in the field (in the case of field or travel blanks) or the laboratory (in the case of laboratory or method blanks). Analyte concentrations should be non-detectable although a DQO of twice the method detection limit allows for slight "noise" around the detection limit.
- **Laboratory Duplicates** are sub-sample pairs created in the laboratory from randomly selected field samples which are sub-sampled and then analyzed independently using identical analytical methods. The laboratory duplicate sample results reflect any variability introduced during laboratory sample handling and analysis and thus provide a measure of laboratory precision.
- **Certified Reference Materials** are samples containing known chemical concentrations that are processed and analyzed along with batches of environmental samples. The sample results are then compared to target results to provide a measure of analytical accuracy. The results are reported as the percent of the known amount that was recovered in the analysis.

A2 FISH TISSUE SAMPLES

A2.1 Holding Time and General Laboratory Flags

All tissue analyses were conducted within ALS Environmental's recommended hold times. There were no general laboratory flags associated with the analytical report (i.e., ALS Environmental Report L2173881; Appendix C).

A2.2 Lowest Detection Limits

All analytes were higher than target detection limits (benchmarks) indicating that the data for this project can be reliably interpreted (Appendix Table A.1).

A2.3 Laboratory Blank Sample Analysis

All blank samples contained non-detectable concentrations indicating no inadvertent contamination of samples within the laboratory during analysis (Appendix C).

A2.4 Data Precision

Data precision was evaluated based on results of laboratory duplicate samples (DUP; Appendix C). All DUP results (177 in total) met ALS Environmental's data quality objectives for precision (Appendix C). Laboratory precision achieved in this study is considered adequate.

A2.5 Data Accuracy

Data accuracy was evaluated based on results of certified reference materials (CRM), and laboratory control samples (LCS; Appendix C). All CRM and LCS results (327 in total) met ALS Environmental's data quality objectives for accuracy (Appendix C). Laboratory accuracy achieved in this study is considered adequate.

A3 DATA QUALITY STATEMENT

Data collected for the 2018 fish tissue monitoring at the Rainy River Project was of good quality as characterized by good detectability, negligible analyte concentrations in method blanks, good laboratory precision, and good laboratory accuracy. Therefore, associated data can be used with a high level of confidence in the derivation of conclusions.

Fish Permit

Ontario

Ministry of Natural Resources

Ministère des Richesses naturelles

Licence to Collect Fish for Scientific Purposes

Permis pour faire la collecte de poissons à des fins scientifiques

Licence No. / N° de permis	1090759
Local Reference No. / N° de référence local	2018-0911
Issuer Account No. / N° de compte du délivreur de permis.	10002668

This licence is issued under Part I of the Fish Licensing Regulation made under the Fish and Wildlife Conservation Act, 1997 to:

Ce permis est délivré en vertu de la Partie I du règlement sur la délivrance de permis de pêche formulé conformément à la Loi sur la protection du poisson et de la faune de 1997 à:

	Last Name / Nom de famille	First Name / Prénom	Middle Name / Second Prénom
Name of Licencee / Nom du titulaire du permis	Mr. Worrall	Tyrell	

Name of Business/Organization/Affiliation (if applicable) / Nom de l'entreprise/de l'organisme/de l'affiliation (le cas échéant)

Minnow Enviroment

Mailing address of Licencee / *Adresse postale du titulaire du permis*

Street Name & No./PO Box/RR#/Gen. Del / N° rue/C.P /R R /poste restante

<Personal information removed>

City/Town/Municipality / Ville/village/municipalité	Province/State Province/État	Postal Code/Zip Code Code Postal/Zip
<Personal information removed>	ON	<Personal information

to collect the species, size and quantites of fish from the waters as set out below.
Pour faire la collecte des espèces suivantes (stade et nombre indiqués ci-dessous):

Species Espèces	Eggs Oeuf X	Juvenile Fretin X	Adults Adulte X	Numbers Nombre	Name of Waterbody Nom de l'étendue d'eau
Northern Pike			X	15	Pinewood River
Walleye			X	15	Pinewood River

Yes/Oui ☐ Additional species/Waterbody list attached / Liste d'espèces/d'étendue d'eau additionnelles ci-jointe

Purpose of collection / *But de la collecte*: To conduct fish tissue monitoring studies of New Gold's Rainy River Project.

Licence Dates / *Dates du permis*	Effective Date / Date d'entrée en vigueur (YYYY-MM-DD)	Expiry Date / Date d'expiration (YYYY-MM-DD)
	2018-09-01	2018-12-31

Licence conditions / *Conditions du permis*: This licence is subject to the conditions contained in Schedule A if included. / Ce permis doit respecter les conditions de l'annexe A si celle-ci est jointe.

Personal information contained on this form is collected under the authority of the Fish and Wildlife Conservation Act, 1997 and will be used for the purpose of licencing, identification, enforcement, resource management and customer service surveys. Please direct further inquiries to the District Manager of the MNR issuing district.

Les renseignements personnels dans ce formulaire sont recueillis conformément à la Loi sur la protection du poisson de la faune, 1997 , et ils seront utilisés aux fins de délivrance de permis, d'identification, d'application des règlements, de gestion des ressources et de sondage sur les services a la clientèle. Veuillez communiquer avec le chef du district du MRN qui délivré le permis si vous avez des questions.

FW0032 (04/00)

Ontario

Licence to Collect Fish for Scientific Purposes
Schedule A – Licence Conditions

Licence No. 1090759
Local Reference No. FF2018-0869
Issuer Account No. 10002668

This licence is subject to the conditions listed below.

1. Mandatory report forms documenting the sampling conducted under this licence must be submitted to the licence issuer within 30 days of the termination date, but in no case later than January 31 next following the year of issue. The digital Mandatory Report form (Part 1) must be completed for each Sampling Program and the digital Site Collection Reports (Part 2) must be completed for each collection site. A separate map clearly indicating the location of each collection site must be attached to the Site Collection Reports. Submit Mandatory Report forms to the Fort Frances District MNRF office. The submission of a satisfactory report is a prerequisite to any subsequent renewals.

2. Sampling locations must be reported using GPS location data using: Projection: Universal Transverse Mercator (UTM); Datum: North American 1983 (NAD83), Canadian Transformation (CNT); Zone: 15 N; Units: metres.

3. Before carrying out any operation under this licence, any person authorized under this licence is required to consult with the Fort Frances Ministry of Natural Resources District Manager at least one week prior to anticipated start of sampling and obtain approval from the respective Manager for the proposed sampling activity. Also, any person authorized under this licence must advise the respective Manager of the date, time and location of all sampling.

4. A copy of the signed original licence must be carried by the licenced person when working at the designated sites. An assistant of the licenced person who is carrying out activities under this licence during the absence of the licenced person shall carry the licence on his or her person.

5. All collection gear shall be clearly marked with the licenced person's and the organization's name.

6. This licence is not valid in Provincial Parks, park reserves, Conservation Authority property or National Parks without written permission from the authorized person in charge of the area concerned.
http://www.ontarioparks.com/email/research

7. Capture gear shall be inspected regularly and live holding traps must be inspected at least once daily.

8. This licence does not allow access to any property without permission of the landowner.

9. The licensee shall follow the best management practices for the collection, handling, transportation and holding of fish identified in **FPS Technical Bulletin (Dec. 15, 2011)** included with the licence in order to minimize the risk of spreading aquatic invasive species and diseases.

10. All field equipment must be de-contaminated prior to use on each water body in order to prevent the spread of exotic species and disease.

11. This licence does not authorize any activity that is prohibited under the federal ***Species at Risk Act*** or the provincial ***Endangered Species Act.***

12. All SAR fish and mussels must also be reported to the OMNR Natural Heritage Information Centre on the appropriate form at:
http://nhic.mnr.gov.on.ca/MNR/nhic/species/species_report.cfm

13. This licence does not authorize the possession of specially protected fish under the ***Ontario Fishery Regulations.***

14. This licence does not authorize the collection of any species of fish protected under the ***Species at Risk Act, Endangered Species Act, or Ontario Fishery Regulations***. If these species are accidentally captured they must be returned to the water immediately.

15. **This licence ONLY allows for the following capture gear to be used:**

    Hoop nets (2" and 3" stretched mesh), gill nets (3", 4", 5" mesh size), angling

16. **Persons authorized under this licence include the following:**

    Tyrell Worrall, Kevin Martens, Katharina Batchelar

17. ***The following MNRF Class Animal Care Protocols will be adhered to as appropriate for the project activity:***
    - ***Capture Methods- Electrofishing***
    - ***Capture Methods- Seining***
    - ***Capture Methods- Impounding Gear***
    - ***Handling and Marking- Biological Sampling***
    - ***Containment- Short term Containment***

Reference Information

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
HG-DRY-CVAFS-N-VA	Tissue	Mercury in Tissue by CVAFS (DRY)	EPA 200.3, EPA 245.7

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

HG-DRY-MICR-CVAF-VA	Tissue	Mercury in Tissue by CVAFS Micro (DRY)	EPA 200.3, EPA 245.7

This method is adapted from US EPA Method 200.3 "Sample Procedures for Spectrochemical Determination of Total Recoverable Elements in Biological Tissues" (1996). Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with repeated additions of hydrogen peroxide. Analysis is by atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

MET-DRY-CCMS-N-VA	Tissue	Metals in Tissue by CRC ICPMS (DRY)	EPA 200.3/6020A

This method is conducted following British Columbia Lab Manual method "Metals in Animal Tissue and Vegetation (Biota) - Prescriptive". Tissue samples are homogenized and sub-sampled prior to hotblock digestion with nitric and hydrochloric acids, in combination with addition of hydrogen peroxide. Instrumental analysis is by collision cell inductively coupled plasma - mass spectrometry (modified from EPA Method 6020A).

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MET-DRY-MICR-HRMS-VA	Tissue	Metals in Tissue by HR-ICPMS Micro (DRY)	EPA 200.3/200.8

Trace metals in tissue are analyzed by high resolution inductively coupled plasma mass spectrometry (HR-ICPMS) modified from US EPA Method 200.8, (Revision 5.5). The sample preparation procedure is modified from US EPA 200.3. Analytical results are reported on dry weight basis.

Method Limitation: This method employs a strong acid/peroxide digestion, and is intended to provide a conservative estimate of bio-available metals. Near complete recoveries are achieved for most toxicologically important metals, but elements associated with recalcitrant minerals may be only partially recovered.

MOISTURE-MICR-VA	Tissue	Moisture in Tissue	Puget Sound WQ Authority, Apr 1997

This analysis is carried out gravimetrically by drying the sample at <60 deg. C.

MOISTURE-TISS-VA	Tissue	% Moisture in Tissues	Puget Sound WQ Authority, Apr 1997

This analysis is carried out gravimetrically by drying the sample at 105 C for a minimum of six hours.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
VA	ALS ENVIRONMENTAL - VANCOUVER, BRITISH COLUMBIA, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid weight of sample
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Legend:

Limit	ALS Control Limit (Data Quality Objectives)
DUP	Duplicate
RPD	Relative Percent Difference
N/A	Not Available
LCS	Laboratory Control Sample
SRM	Standard Reference Material
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ADE	Average Desorption Efficiency
MB	Method Blank
IRM	Internal Reference Material
CRM	Certified Reference Material
CCV	Continuing Calibration Verification
CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Sample Parameter Qualifier Definitions:

Qualifier	Description
J	Duplicate results and limits are expressed in terms of absolute difference.
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

NEW GOLD RAINY RIVER MINE
APPENDIX H
SPILL REPORTING PROCEDURE

newgold™ Rainy River Project		ENV-PRO-001-15A Site Wide Spill Reporting Procedure	
Owner: Environmental Specialist	**Approver**: Darrell Martindale Chris McGoldrick	Status: **Draft**	**Date Created:** July 11, 2015
		Review Frequency: **3 Years**	**Effective Date:** October 19, 2016

1. Purpose

The purpose of the following document is to clarify spill reporting requirements and responsibilities for those working on the Rainy River Project site including spill tracking and external required reporting.

This document is designed to be consistent with Federal and Provincial Reporting Regulations, Corporate Standards for spill reporting (EMS Standard 008.01) and aligned with additional agreements New Gold has entered into.

2. Scope

This procedure is an outline of the spill reporting responsibilities for anyone working on the Project Site.

3. Definitions

Spill

A spill is defined as a “spill”, when used with reference to a pollutant, and means a discharge:

(a) into or onto the natural environment,

(b) from or out of a structure, vehicle or other container, and

(c) is abnormal in quality or quantity in light of all the circumstances of the discharge.

Spills requiring reporting under this requirement do not include approved discharges such as discharges to air, water and land approved under the Environmental Protection Act (EPA) or other regulatory approval provided the discharge is compliant with the approval. Further exempt from this reporting requirement are any other areas exempted by the Regulation e.g., planned spills.

Spill volume is the amount of material that contacted the environment (ground, water or air). The Project Site is defined as;

- All project components plus approximately 100 m zone;
- Highway 600 from Hwy 71 to Seven Bends;
- Teeple Road from Hwy 71 to Hwy 600;
- Municipal roads used for access including but not limited to Teeple Road, Roen Road, Korpi Road and Eluik Road; or

As designated by the Construction Director as the Project progresses

4. Responsibilities and Accountabilities

Construction Management and General Manager

- Support implementation of the Reporting Procedures
- Conduct follow up investigation

Department and Area Managers

- Support the Procedure and ensure respective areas support the plan and all of its components
- Lead follow up investigation

Environmental Department

- Provide support on reporting and clean up including sampling where necessary
- Support the root cause analysis process
- Provide external reporting guidance
- Maintain a registry of all spills
- Distribute spill information to authorized internal and external stakeholders

Supervisors (of the crew reporting the spill)

- Spill is reported consistent with this procedure based on size of spill and location
- Spill is cleaned up properly and contaminated waste management disposed of appropriately, with records of disposal included with the Spill Report
- Spill kits are restocked after any products used
- Record of removal of spilled material is sent to the Environmental Dept.
- Any contaminated material is sent to a location approved for this purpose by the Environmental Department
- Support follow up investigation

Employees and Contractors

- Report spills and respond appropriately, consistent with spill response requirements

5. Guidelines & Instructions

- **Reporting Requirements**

All spill reporting must meet general requirements (see Appendix 1)

- All spills to be reported immediately to crew supervisors.
- Crew supervisors to determine immediate response.
- All spills to be documented using the Spill Reporting Form (Appendix 2) by the person first observing the spill or their supervisor or designate familiar with the spill within the timelines set out in this procedure before the end of shift consistent with site HSE reporting and communication.
- The detailed Spill Report to be copied to the following emails: RainyRiver.Enviro@newgold.com and RainyRiver.Incident@newgold.com
- For New Gold Departments only, the incident details will be entered into InControl software within 24 hours of the occurrence by the supervisor or designate.

Additional requirements for externally reportable spills exceeding mandatory reporting thresholds of O. Reg 675/98 (Table 1) and spills on third party property

within the project site (e.g., municipal roads, Hwy 600, Table 2):

- Supervisor to contact site Environment Team via site radio
- In the event the spill is outside 0700hrs to 1730hrs the initial contact should be directed to:

  i. the H&S team and
  ii. the nominated site Regulatory Contact – Chris McGoldrick or designate and
  iii. Environmental On-Call (Environmental Manager or designate)

Additional requirements for spills that pose an immediate threat to human life/health and sustained and ongoing threat to the environment (e.g., bulk fuels, sediment dam breach, truck roll over):

- Initiate Emergency Response Plan through site radios and indicate environmental emergency
- The Environment On-Call (Environment Manager or designate) will be contacted immediately.

Table 1: Reportable Levels for Different Substances (off municipal/provincial roads) (O.Reg 675/98)

Substance Spilled	Reporting Threshold
Refrigerants (as listed in O Reg 189/94)	100 Kg
Hydrocarbons • Gasoline • Petroleum products	100 L, any if into water
Electrical utilities (excluding PCB's) • Oil from Transformers	100 L, any if into water
Dangerous goods (as listed in TDG act)	*See TDG Act Schedule 1 for complete list*
Class 1, Explosives	10 kg, any quantity that poses a public risk
Class 2, Gases • SO2	Any release of 10 + minutes, any quantity that poses a public risk
Class 3, Flammable Liquids	200 L, any if into water
Class 4, Flammable Solids/Water-Reactive Substances	25 kg, any if into water
Class 5.1, Oxidizing Substances • O2	50 kg/ 50 L
Class 5.2, Organic Peroxides	1 kg/ 1
Class 6, Toxic Substances • Cyanide, Copper Sulfate, Sodium Metabisulfite	5 kg/ 5 L
Class 6.2, Infectious Substances • N/A	Any quantity
Class 7, Radioactive Materials • Nuclear Devices	Any quantity that poses a public risk
Class 8, Corrosives • Hydrochloric Acid, Sodium Hydroxide, Lime	5 kg/ 5 L
• Class 9, Miscellaneous Products, Substances or Organisms such as fertilizer, tailings and contaminated water	25 kg/ 25 L

Table 2: Exemptions for spill reporting on Highways	
ID	**Description**
(a)	Less than 100 L of fluid other than other than fluid transported as cargo, from the fuel system or other operating system of a motor vehicle.
(b)	the spill does not enter and is not likely to enter any waters, as defined in the Ontario Water Resources Act, directly or through drainage structures
(c)	the spill does not cause and is not likely to cause any adverse effects, other than those that are readily remediated through cleanup and restoration of surfaces that are prepared for vehicular traffic or paved, graveled, sodded areas adjacent to those surfaces
(d)	Arrangements for the remediation referred to in clause (c) are made and carried out immediately.

- **Documentation**

The Spill Report Form will be used as the investigation report. The report must be completed prior to the end of shift. The Supervisor or Area Manager for that area of works is responsible for ensuring its completion and submission prior to the end of shift.

All records must be maintained for 5 years in New Gold's incident reporting system, InControl.

Spills

- The Spill Report is to be produced as above and is the responsibility of the Supervisor or Area Manager before the end of shift.
- New Gold Environment Team will update site spill log consistent with O.Reg 675/98
- Every quarter an internal spill will have a follow up investigation, for the purpose of spill prevention, by the Environmental Department.

Where spills are externally reportable

- Contact the Environment On-Call immediately
- The Environment Manager or designate will contact the Management Group and any external reporting requirements.
- The Spill Report is to be produced as above and is the responsibility of the Supervisor or Area Manager before the end of shift
- Spill reporting to be entered into InControl software by the H&S team and ranked in InControl based on Consequence/Severity table as defined by 002.06_Corporate ESR Incident Reporting Guidelines.
- Follow up investigations may be required.

6. References

7. Appendix

Appendix 1: Site Spill Response Flow Chart

Appendix 2: Spill Reporting Form

CONTROLLED DOCUMENT
Printed copies are uncontrolled within 24 hours
Information within is privileged and not for redistribution

Appendix 1

SITE SPILL RESPONSE

Communicate spill to supervisor

Cease flow from source, If Safe To Do So

Contain spill from spreading, If Safe To Do So

Does spill pose immediate threat to human life/health and sustained and ongoing threat to the environment?

YES

Initiate emergency response plan through site radios and indicate environmental emergency.

- Supervisor to contact site Environmental Team via site radio Channel 4.
- Complete spill report (Attachment 2) and submit to RainyRiver.Enviro@newgold.com and RainyRiver.Incident@newgold.com
- A preliminary spill investigation to be completed **before end of shift** using documentation as for a safety incident.
- A final spill investigation report to be completed **within 24 hours** following a meeting to review the outcome of the preliminary report.

- Clean up spill properly and contaminated waste management disposed of appropriately.
- Restock spill kits after any product is used.

NO

Is the spill externally reportable…?

- A hydrocarbon over 100 L?
- An in water spill of any amount of any product?
- On third party property?
- A gas release of 10+ minutes?
- An explosive spill over 25 kg?
- A flammable liquid over 200 L?
- A refrigerant over 100 kg?

NO

- Clean up spill properly and contaminated waste management disposed of appropriately.
- Restock spill kits after any product is used.
- Complete spill report and submit to RainyRiver.Enviro@newgold.com and RainyRiver.Incident@newgold.com

newgold™ Rainy River		ENV-SOP-0002 Environmental Department Spill Reporting Procedure	
Owner: Senior Environmental Specialist	**Approver:** Manager Environment	Status: **Approved**	**Date Created:** July 11, 2015
		Review Frequency: **1 Year**	**Effective Date: February 1st, 2018**

1. Purpose

The purpose of the following document is to clarify spill reporting responsibilities of the Environmental Department for the Rainy River Mine including spill tracking and external required reporting. This document is designed to be consistent with Federal and Provincial Reporting Regulations, Corporate Standards for spill reporting (EMS Standard 008.01) and aligned with additional agreements New Gold has entered into. Spill response requirements and responsibilities for those working on the Rainy River Mine can be found in ENV-SOP-0001.

2. Scope

This procedure is an outline of the spill reporting responsibilities for the Environmental Department.

3. Definitions

Spill	A spill is defined as a "spill", when used with reference to a pollutant, and means a discharge: (a) into or onto the natural environment, (b) from or out of a structure, vehicle or other container, and (c) that is abnormal in quality or quantity in light of all the circumstances of the discharge. Spills requiring reporting under this requirement do not include approved discharges such as discharges to air, water and land approved under the Environmental Protection Act (EPA) or other regulatory approval provided the discharge is compliant with the approval. Spill volume is the amount of material that contacted the environment (ground, water or air).
Project Site	The Project Site is defined as; • All project components plus approximately 100 m zone; • Highway 600 from Hwy 71 to Seven Bends; • Teeple Road from Hwy 71 to Hwy 600; • Municipal roads used for access including but not limited to Teeple Road, Roen Road, Korpi Road and Eluik Road; or • As designated by the Construction Director as the Project progresses.

4. Responsibilities and Accountabilities

Rainy River Manager Environment

- Approves this policy and ensures its communication to site personnel
- Oversees the Environmental Department to ensure compliance with this procedure
- Is responsible to ensure reportable spills are communicated appropriately to regulatory bodies in line with approvals and reporting requirements

Environmental Department

- Provide support to Rainy River personnel and contractors in regards to spill response and reporting, including sampling where necessary
- Maintains an on call schedule to ensure support is provided to mine personnel 24 hours a day
- Contacts the Spill Action Centre as a first contact after a reportable spill
- Compiles incident details and composes follow up letters detailing incidents to regulators
- Maintain a registry of all spills
- Distribute spill information to authorized internal and external stakeholders

Department and Area Managers

- Support the procedure and ensure departmental staff follow its expectations
- Ensure departmental Supervisors are trained to lead the spill response within their crews and are famillure with the external reporting thresholds
- Support any follow up investigations as required

Supervisors (of the crew reporting the spill)

- Ensure that the spill incident procedure is managed effectively and limits impact to the environment as much as possible
- Report all spills consistent with ENV-SOP-0001 and determine if spills are externally reportable
- Lead any follow up investigations

Employees and Contractors

- Report all spills and respond appropriately, consistent with spill response requirements as detailed further in ENV-SOP-0001

5. Guidelines & Instructions

Spills that pose an immediate threat to human life/health and sustained and ongoing threat to the environment (e.g., bulk fuels, sediment dam breach, truck roll over):

- Initiate Emergency Response Plan through site radios and indicate Environmental emergency
    - The Environment On-Call (Environment Manager or designate) will be contacted immediately.

5.1 Spill Response

- The Environmental Department will be called as soon as possible following an Externally Reportable Spill as outlined in ENV-SOP-0001
    - via radio Channel 4 or phone 1-807-632-6152
- The main function of the Environmental Department during the initial spill responde is to provide immediate assistance to site personnel in relation to the containment of the spill and remedial actions necessary

5.2 Regulatory Reporting

Externally reportable spills exceeding mandatory reporting thresholds of O. Reg 675/98 (Table 1) and spills on third party property within the project site (e.g., municipal roads, Hwy 600, Table 2):

- Environmental Manager or designate to follow "Environmental Reportable Incident Call List" Appendix 3.
- The Manager or designate will contact the Spills Action Center at 1-800-268-6060 and report:
    - your name and phone number
    - name and phone number of the person or company in control of the product spilled
    - date, time and location of the spill
    - duration of the spill (if known) and whether the spill is ongoing
    - type and quantity of pollutant spilled, including hazard level or toxicity information
    - source of the spill and information on the cause
    - description of adverse effects
    - environmental conditions that affect the spill (weather, traffic, etc.)
    - actions being taken to respond
    - other agencies and parties responding
- A follow-up report detailing the incident must be submitted via a transmittal to regulatory bodies within the time frames detailed below. The report must include:
    - The measures that were taken to mitigate the effects of the occurrence;
    - If an emergency response plan was implemented, details concerning its implementation; and
    - Changes made to avoid a subsequent occurrence of the accident or malfunction.
        - MOECC within 7 days of incident.
        - MNRF within 7 days of incident, if TSS or Fisheries related.
        - DFO within 30 days of incident.
        - ECCC within 30 days of incident, Adam Scheepers and Dan McDonell.
        - CEAA within 30 days of incident.
- New Gold Environmental Department will update the spill incident in InControl consistent with O.Reg 675/98 when Spill Report Form is received.
    - Classify incidents according to the NG Risk Consequence categories (Level 1, 2 or 3) as per 008.04 Incident Assessment and Response Matrix

5.3 Follow up Investigation

- Following the initial incident and once clean up has been completed, an initial investigation of the incident should take place. This will be lead by the Supervisor responsible for the area in which the spill occurred with the support of The Environmental Department.

    - The investigation should include all information required for the follow up report as detailed above and focus on implementing measures to reduce the chance of reoccurance

- Root cause analysis is required for all significant incidents. Spills which require this as per 002.06_CORPORATE ESR INCIDENT REPORTING GUIDELINES are:
    - Cyanide spills outside of normal processing area.
    - Hydrocarbon spills that trigger requirement to report to regulatory authorities.
    - Other spills that trigger requirement to report to regulatory authorities.

Table 1: Reportable Levels for Different Substances (off municipal/provincial roads) (O.Reg 675/98)	
Substance Spilled	**Reporting Threshold**
Refrigerants (as listed in O Reg 189/94)	100 Kg
Hydrocarbons • Gasoline • Petroleum products	100 L, any if into water
Electrical utilities (excluding PCB's) • Oil from Transformers	100 L, any if into water
Dangerous goods (as listed in TDG act)	*See TDG Act Schedule 1 for complete list*
Class 1, Explosives	10 kg, any quantity that poses a public risk
Class 2, Gases • SO2	Any release of 10 + minutes, any quantity that poses a public risk
Class 3, Flammable Liquids	200 L, any if into water
Class 4, Flammable Solids/Water-Reactive Substances	25 kg, any if into water
Class 5.1, Oxidizing Substances • O2	50 kg/ 50 L
Class 5.2, Organic Peroxides	1 kg/ 1
Class 6, Toxic Substances • Cyanide, Copper Sulfate, Sodium Metabisulfite	5 kg/ 5 L
Class 6.2, Infectious Substances • N/A	Any quantity
Class 7, Radioactive Materials • Nuclear Devices	Any quantity that poses a public risk
Class 8, Corrosives • Hydrochloric Acid, Sodium Hydroxide, Lime	5 kg/ 5 L
Class 9, Miscellaneous Products, Substances or Organisms	25 kg/ 25 L
Tailings	Any Amount is reportable
Emulsion	Any Amount is reportable

Table 2: Exemptions for spill reporting on Highways	
ID	**Description**
(a)	Less than 100 L of fluid other than other than fluid transported as cargo, from the fuel system or other operating system of a motor vehicle.
(b)	the spill does not enter and is not likely to enter any waters, as defined in the Ontario Water Resources Act, directly or through drainage structures
(c)	the spill does not cause and is not likely to cause any adverse effects, other than those that are readily remediated through cleanup and restoration of surfaces that are prepared for vehicular traffic or paved, graveled, sodded areas adjacent to those surfaces
(d)	Arrangements for the remediation referred to in clause (c) are made and carried out immediately.

6. Documentation

The Spill Report Form is to be completed by Supervisor or Designate of the area in which the spill occurs.

For New Gold Departments only, the incident details are to be entered into InControl software by the supervisor or designate as soon as possible and before shift end.

The Environment Department will update INControl consistent with O. Reg 675/98.

A follow up report is to be sent to the following agencies within the time frames specified below:
Ministry of the Environment and Climate Change (MOECC) - Within 7 Days

Ministry of Natural Resources and Forestry (MNRF) – Within 7 Days

EnvironmentCanada (EC) – Within 30 Days

Department of Fisheries and Oceans (DFO) – Within 30 Days

Canadian Environmental Assessment Agency (CEAA) – Within 30 Days

Every quarter the Environmental Department will review all spills on site and conduct Spill Audits on 10% of reported spills as per ENV-SOP-0006

Root Cause Analysis completed on all externally reportable spills as per EMStd-008.1 Incident and Crisis Management.

ENVIRONMENTAL DEPT. SPILL RESPONSE

Spill reported to Environmental Department via radio, phone or Rainy River Enviro mailbox

Is spill externally reportable?

Is the spill...

- A hydrocarbon over 100 L?
- Sediment release causing TSS greater than 30mg/L?
- Spilled substance into a water body (i.e. a stream, pond, swamp)?
- On third party property?
- A gas (SO2) release of 10+ minutes?
- An explosive spill over 25 kg?
- A flammable liquid over 200 L?
- A refrigerant over 100 kg?

- Ensure Spill Reporting Form, Attachment 2, is completed and sent to rainyriver.enviro@newgold.com and rainyriver.incident@newgold.com.
- Update Site Spill Log in INControl.

YES

Follow Environmental Reportable Incident Call List Attachment 3

- Draft Spill Report Letter (follow previous letter templates)
- Have letter reviewed by Enviro team member and Environmental Manager or designate

- Email letter to Matt Hoffmeister (MOECC) within 7 days matt.hoffmeister@ontario.ca
- If TSS/Fisheries related, email letter to Karli Allen (MNRF) within 7 days karli.allen@ontario.ca
- Email letter to Andrea Doherty (DFO) within 30 days andrea.doherty@dfo-mpo.gc.ca
- Email letter to Adam Scheepers and Dan McDonell (ECCC) within 30 days adam.scheepers@canada.ca and dan.mcdonell@canada.ca
- Email letter to CEAA within 30 days compliance.conformite@ceaa-

NEW GOLD RAINY RIVER MINE
APPENDIX I
EXCEEDANCE TABLE

newgold™ Rainy River

2018 Regulatory Reportable Exceedances, Complains and Spills

Incident	New Gold or Contractor	Spill Origin	Date and Time Reported	Product Spilled	Impact	Quantity	Description & Cause	Remediation & Disposal	Reported	Transmittal #
Spill	New Gold	Mill Operations	2018-01-03	Reclaim Water	Land	500 L	Conveyor transfer tower fire suppression system activated and extinguished by a false alarm (which was a frozen pipe) spilling 500 L of reclaim water.	Reclaim water that travelled outside of west access door froze. Ice material was scraped up and returned to mill process. Reject sump filled and was pumped back onto mill process.	Yes	IFI-0048
Spill	New Gold	Warehouse	2018-03-16	Gear Lubricant	Land	136L	During movement of 45 Gallon drums of Vultrex Gearshield, the telehandler punched a hole in a drum causing 3/4 of the contents to leak out onto the snow and ice surface in the laydown yard at Barron warehouse.	Hydrocarbon, snow, ice, sand and spill pads collected and placed into 40 Gallon drums for removal from site by GFL.	Yes	IFI-0058
Spill	Contractor	TMA North Dam	2018-04-21	Chemical	Land	450L	Loader operator punctured propylene glycol tote with forks causing glycol to spill onto frost protection sand.	Equipment and operators assisted in cleanup. Glycol contaminated sand was dug up and placed into contaminated soil bin for removal from site. Area inspected by New Gold Environment.	Yes	IFI-0069
Exceedance	New Gold	Operations	2018-04-27	24-hr Total Suspended Particulates and Iron	Air	N/A	Laboratory results for March air quality monitoring at Gallinger Road air quality station indicated exceedance of total suspended particulates (TSP) and iron. Exceedances caused by increased vehicle traffic along Gallinger Road.	Remediation includes immediate closure of Gallinger Road to all mine employees travelling to and from the site and regular patrolling by New Gold Management to enforce closure.	Yes	IFI-0072
Spill	New Gold	Mill Processing Plant	2018-05-13	Chemical	Land	26 kg	Transport driver was transferring high calcium lime from tanker truck to the lime silo on the plant site. During the transfer, the delivery hose ruptured spilling approximately 26 kg of granular lime onto the ground.	Granular lime, gravel and dirt collected by mini Bobcat excavator and shoveled into the mill for disposal. Contractor required to replace hose and maintain inspection records on site.	Yes	IFI-0040 Rev B
Spill	New Gold	Open Pit	2018-05-23	Hydrocarbon	Land	3000 liters	Return hydraulic line ruptured releasing 3000 liters onto pit floor.	Hydrocarbons on pit floor were removed by GFL vac truck and taken to Thunder Bay for disposal.	Yes	IFI-0074
Exceedance	New Gold	NORTH AIR QUALITY MONITORING STATION	2018-06-06	DUST	Air	464 micro grams	On April 8 the North air quality monitoring station detected higher than normal levels of dust due to dryer than normal conditions and increased traffic use.	Traffic was restricted and mitigation plan is to cap all on site roads with calcium chloride.	Yes	IFI-0072 Rev C
Spill	New Gold	Processing Plant	2018-06-09	Process Water	Land	500 Liter	Process water overflowed a collection tank. A pump was disconnected causing water to spill out into the truck alley. Excess water overflowed outside the building.	Water transfers stopped until area is clear of water and there was no further risk of water leaving building. Sandbags berm was constructed to stop flow of water outside the building. The event occurred within the immediate area of the mill process building with no impact to any water bodies. Gravel saturated by the spill was dug up and placed inside the mill for processing.	Yes	IFI-0034 Rev D
Spill	New Gold	Tailings Corridor	2018-06-15	Tailings	Land	10 Liters	A pin hole leak in the tailings pipeline resulted in a release of slurry into the tailings containment corridor area.	Mill was shutdown and vacuum truck successfully cleaned spill and disposed of slurry into TMA cell #1	Yes	IFI-0035 Rev B
Spill	Contractor	Borrow Pit	2018-07-15	Hydrocarbon	Land	115 Liters	Excavator blew hydraulic line while loading clay into rock truck in Borrow Pit.	Spill kit was used and area was scraped clean and 40 tons of clay material was placed in certified contamination bin for removal from site.	Yes	IFI-0074 REV B

Spill	New Gold	Process Plant	2018-08-20	Process Water	Land	57 Liters	During pumping of water from inside the process mill pump discard line flipped back over secondary containment wall spilling 57 L of process water onto the access road of door 17W.	Water and mud scrapped up from in front of 17W door and deposited into leach tank secondary containment area. Spill successfully cleaned up by 18:00 hours.	Yes	IFI-0034 Rev E
Spill	New Gold	Process Plant	2018-08-31	Process Water	Land	20 Liters	Water from the grinding circuit migrated out the door 11E.	Water and mud scraped up and deposited into leach tank secondary containment area. Spill successfully cleaned.	Yes	IFI-0034 Rev F
Spill	New Gold	Process Plant	2018-09-13	Tailings Slurry	Land	1000 Liters	A tailings pump kicked out and slurry overflowed the containment and flowed outside doors 9E and 4N.	Grinding operator had a loader operator dump sand at the effected doors to limit the spill out the doors. The spill was cleaned up during the night shift.	Yes	IFI-0078
Spill	New Gold	Plant Site	2018-09-15	Hydrocarbon	Land	100 Liters	Heavy rains during night of September 15th caused flooding of plant site ditching system. Water flooded mill fuel storage laydown area, causing gear oil tote to topple over and spill contents.	All totes and barrels were removed from area. A skid steer excavator scrapped up mud, water, sand, gravels and vegetation. All contaminated materials were deposited into 20 yd3 bin. The bin was removed from site and contaminated material deposited in the Richardson Landfill.	Yes	IFI-0079
Vibration Complaint	New Gold	Land	2018-09-25	Vibration Complaint	Land	n/a	Vibration complaint received from neighbor regarding the 11:00 am blast on September 25, 2018 for the East mine rock stockpile.	Investigation is underway.	Yes	IFI-0020 Rev G
Spill	New Gold	Land	2018-09-27	Chemical	Land	264 gallons	264 gallons of Tris Sulphate spilled at the north end of the mill due to a punctured tote when employee was unloading the tote off of a delivery truck.	Area was bermed off and contained. Chemical was neutralized during the rain event on the day. Contaminated soil was transferred to cell 1 for further treatment.	Yes	IFI-0082
Spill	New Gold	Land	2018-10-01	Hydrocarbon	Land	200 L	While moving totes operator punctured a tote of gear oil.	Leak was contained using spill pads. Soil was placed in certified containment bins for removal from site.	Yes	IFI-0083
Spill	New Gold	Air	2018-11-22	Dust	Land		Due to lack of water in cell 1 of the TMA dust was created	Water was placed on cell 1 to prevent dust from forming.	Yes	IFI-0087
Spill	New Gold	Land	2018-11-27	Tailings	Land		Leak in tailings corridor	Tailings were dumped into tailings spill ponds where the mill tailings lines go to.	Yes	IFI- 0078 Rev B
Spill	New Gold	East Outcrop	2018-12-20	Hydrocarbon	Land	450 Liters	Punctured fuel tank on drill	Vacuum truck was utilized and material was placed in certified containment bin for removal from site	Yes	IFI-0015 Rev D
Exceedance	New Gold	Noise	2018-06-03	Sound Threshold Exceedance	Noise	51 to 54 dBA	Monitoring stations picked up sound threshold levels of 51 to 54 dBA. Upon investigation it was determined these sound thresholds were caused by weather events (wind).	Reported to MNRF - Natural event no remediation required.	Yes	IPT-0097 Rev B
Potential Exceedance	New Gold	Noise	2018-05-05	Monitoring equipment recorded sound levels exceeding a 50 dBA sound threshold	Noise	>50 dBA	Acoustic audit monitoring equipment in Whip-poor-will habitat areas recorded noise levels exceeding permitted limits on two occasions. Monitoring equipment recorded sound levels of 60 dBA at 3 am on May 1st and 52 dBA at 11 pm on May 3rd.	Reported to MNRF - Natural event no remediation required.	Yes	IPT-0097
Exceedance	New Gold	Noise	2018-06-06	Sound Threshold Exceedance	Noise	51 to 52 dBA	Monitoring stations picked up sound threshold levels of 51 to 52 dBA. Upon investigation it was determined these sound thresholds were caused by weather events (wind).	Reported to MNRF - Natural event no remediation required.	Yes	IPT-0099

NEW GOLD RAINY RIVER MINE
APPENDIX K
COMPLAINTS REPORTS TO FIRST NATIONS AND COMMUNITIES

newgold™ Rainy River

New Gold Rainy River Mine Weekly Exceedance and Spill Report for Period November 26 - December 2, 2018

INX #	SPILL REPORT	New Gold or Contractor	Spill Origin	Date and Time Reported	Product Spilled	Impact	Quantity	Description & Cause	Remediation & Disposal	Externally Reportable SAC	Externally Reportable MECP
207931	SPILL	New Gold	Land	11/26/18 12:00 AM	Hydrocarbon	Land	70 Liters	Fuel escaped from the low flow hose while equipment was parked. The handle had been removed and not properly capped off.	Spill pads were used and contaminated material was removed and placed in a certifed containment bin for removal from site.	NO	NO
208024	SPILL	New Gold	Land	11/27/18 12:00 AM	Tailings	Land	30 Liters	The collar that was installed onto the tailings line came loose and sprayed from the side. Most of the spray was contained but some sprayed onto the tailings line roadway.	The spray was located quickly and maintenance tightened the collar. Soil was scooped up and placed in the tailings spill pond.	YES	YES

newgold™ Rainy River

New Gold Rainy River Mine Weekly Exceedance and Spill Report for Period October 29 - November 4, 2018

INX #	SPILL REPORT	New Gold or Contractor	Spill Origin	Date and Time Reported	Product Spilled	Impact	Quantity	Description & Cause	Remediation & Disposal	Externally Reportable SAC	Externally Reportable MOECC
206151	Spill	Contractor	Land	10/31/18 11:57 AM	Hydrocarbon	Land	3 Liters	While working, dozer operator noticed hydraulic oil leaking from machine.	Equipment was shut down, spill pads were placed. 1/2 cubic meter of material was removed and placed in certified containment bin for removal from site.	No	No

newgold™ Rainy River

New Gold Rainy River Mine Weekly Exceedance and Spill Report for Period November 19 - 25, 2018

INX #	SPILL REPORT	New Gold or Contractor	Spill Origin	Date and Time Reported	Product Spilled	Impact	Quantity	Description & Cause	Remediation & Disposal	Externally Reportable SAC	Externally Reportable MECP
207632	Spill	Contractor	Land	11/21/18 12:00 AM	Hydrocarbon	Land	3 Liters	Oil was observed leaking from an idling dozer.	Equipment was shutdown immediately, spill tray was placed under dozer. Contaminated material was scraped up and placed in a certified containment bin for removal from site.	No	No
207671	Spill	New Gold	Air	11/22/18 12:00 AM	Dust	Air		Due to lack of water in cell 1 of the TMA and windy conditions, dust was created and blew outside the mine footprint.	Water was placed In cell 1 to prevent dust from forming.	Yes	Yes
207831	Spill	New Gold	Land	11/25/18 12:00 AM	Hydrocarbon	Land	20 Liters	Leak from Fuel Supply Truck	Dirt and gravel were scraped from the spill area and placed in certified containment bin for removal from site.	No	No

newgold Rainy River Project

New Gold Rainy River Mine Weekly Exceedance and Spill Report for Period May 14 to 20, 2018

Spill Report	New Gold or Contractor	Spill Origin	Date and Time Reported	Product Spilled	Impact	Quantity	Description & Cause	Remediation & Disposal	Externally Reportable SAC	Externally Reportable MOECC
Spill	Contractor	4A Stockpile West side of Georgeson Road	17/05/2018 6:30 AM	Hydrocarbon	Land	10 L	While 350 excavator was operating on top of sand stockpile a hydraulic hose ruputred and sprayed 10 liters of hydraulic oil onto the pile	Excavator shut down. Spill tray and pads in place. Supervisor and Safety notified. Maintenance on scene to repair failed hose. Clean up was successful.	No	No

New Gold Rainy River Mine Weekly Spill Report for Period Jan 1st - 7th, 2018

Spill Report	New Gold or Contractor	Spill Origin	Date and Time Reported	Product Spilled	Impact	Quantity	Description & Cause	Remediation & Disposal	Externally Reportable SAC	Externally Reportable MOECC
Spill	New Gold	Mill Operations	2018.01.03 08:30	Reclaim Water	Land	500 L	Conveyor transfer tower fire suppression system activated and extinguised by a false alarm (which was a frozen pipe) spilling 500 L of reclaim water.	Reclaim water that travelled outside of west access door froze. Ice material was scraped up and returned to mill process. Reject sump filled and was pumped back onto mill process.	Yes	Yes

New Gold Rainy River Mine Weekly Spill Report for Period Jan 8th to 14th, 2018

Spill Report	New Gold or Contractor	Spill Origin	Date and Time Reported	Product Spilled	Impact	Quantity	Description & Cause	Remediation & Disposal	Externally Reportable SAC	Externally Reportable MOECC
Spill	New Gold	Contractors	2018.01.09 22:00	Diesel	Land	0.75 L	An overflow of fuel tank on service truck resulted in 0.75 L of diesel fuel spilled on ground at Marr site fueling facility.	Approximately 0.75 L of diesel fuel mixed with snow was removed and placed into containment bin for removal from site. Equipment was cleaned and all materials disposed of properly.	No	No
Spill	New Gold	Construction	2018.01.10 15:00	Motor Oil	Land	30 L	Excavator working on breaking materials at Dam 4/5 lost it's environmental plug and spilled 30 L of motor oil on the ground.	Engine alarm was triggered and equipment immediately shut down. Spill pads were placed, scene frozen and mechanic called for repair. Environmental drain plug re-installed, excavator oil replaced. Approximately 2 m2 of materials (rock and spill pads) placed into contamination bin for removal from site.	No	No
Spill	New Gold	Construction	2018.01.12 11:15	Gylycol	Land	1.5 L	Preset-Piling Loader operator drove over glycol line which punctured hose causing ~1.5L spill	Contained spill with pads. Glycol line shut off and contractor notified to remove/repair the line. Glycol fluid leaked out of the line onto a poly sheet which contained the spill from expanding out on the ground. Glycol line was under a tarp which was covered and right beside route where equipment travels. Mitigation includes placing delineators along outside edge of glycol lines around work area. Locate edge of tarp and glycol line. Poly sheet, spill pads and snow placed into hazardous material bag for removal from site.	No	No
Spill	New Gold	Construction	2018.01.13 00:00	Motor Oil	Land	2.5 L	Excavator cooler coupler fitting shrunk in cold temperature and caused oil leak.	Scene frozen. Labor crew called in for cleanup. Mechanic called to assess and repair excavator, spill tray placed under area to prevent further contamination. Mechanical assessment was the cooler coupler rubber shrank due to extreme temperatures (-35 deg C or below). All containments have been successfully removed and disposed of. Approximately 1/8 of contamination bag placed into bin for removal from site.	No	No

Dear Mr. Hoffmeister,

RE:1000L Ferrous Sulfate Spill – SAC Reference #2157-B4ZRSU

On September 27th at approximately 1600, ferrous sulfate was discharged onto the ground, north west of the mill.

This reagent was new onsite as it is being tested for possible use. The spill was caused by a forklift puncturing a tote containing ferrous sulphate while unloading the tote. (See photo below)

The ferrous sulphate was found immediately after the spill occurred, by the forklift operator.

There was no impact to any water bodies as the spill was discharged in a gravel parking lot and was contained by berms. The spill was caught quickly by the operator and work ceased. The spill was collected by a vac truck and pumped into the tailings management area on site. Also, it is worth noting that during the spill it was raining, and water is a neutralizing agent for ferrous sulphate.

Forklift operations procedures will be reviewed. If ferrous sulphate is used permanently it will be kept in a structure that will help mitigate the risk of any future spill.

Once you have had the opportunity to review this information please feel free to contact the undersigned or Sylvie St.Jean (at Sylvie.St.Jean@newgold.com or 807-707-3497) with any additional questions.

Regards,

Dear Mr. Vandenbroeck,

RE: 2018 ESA ACOUSTIC AUDIT – EXCEEDANCE OF SOUND THRESHOLD

As per Endangered Species Act (ESA) Permit FF-C-001-14 conditions 4.1 (g) and 4.2 (b), New Gold is providing notification to the Ministry of Natural Resources and Forestry (MNRF) that sound level thresholds were exceeded during the ongoing acoustic audit.
The source of noise resulting in the exceedance, however, appears unrelated to construction or operations activities and as such, no immediate mitigation is proposed.

The following preliminary results received from sound recording equipment on June 2nd, 3rd and 4th 2018 exceeded the 50 dBA sound level threshold:

- At 00:00, 1:00, 2:00 and 7:00 on June 2, 2018, monitoring equipment recorded sound levels of 54, 51, 53 and 51 dBA at the North Receptor Habitat and 51, 51 and 51 dBA at the South Receptor Habitat. Recorded sound levels indicate that the exceedances were likely due to strong winds.
  Please refer to attached sound files NRM June.02.2018_0007-0017, NRM June.02.2018_0107-0117, NRM June.02.2018_0207-0217, NRM June.02.2018_0707-0717, SRM June.02.2018_0011-0021, SRM June.02.2018_0111-0121 and SRM June.02.2018_0211-0221.

- At 11:00, 12:00, 14:00, 15:00, 16:00 and 17:00 on June 3, 2018, monitoring equipment recorded sound levels of 53, 55, 53 and 51 dBA at the North Receptor Habitat and 51, 51, 54, 54, and 53 dBA at the South Receptor Habitat. Recorded sound levels indicate that the exceedances were likely due to strong winds.
  Please refer to attached sound files NRM June.03.2018_1419-1429, NRM June.03.2018_1519-1529, NRM June.03.2018_1619-1629, NRM June.03.2018_1719-1729, SRM June.03.2018_1120-1130, SRM June.03.2018_1220-1230, SRM June.03.2018_1420-1430, SRM June.03.2018_1520-1530 and SRM June.03.2018_1620-1630.

Dear Mr. Hoffmeister,

RE: GEAR OIL SPILL - SAC REFERENCE # 5225-B562KD

Further to the notification to the Spills Action Center (SAC) Reference # 5225-B562KD regarding a spill of gear oil on October 1, 2018, the following report is submitted to the Ministry of the Environment, Conservation and Parks (MECP) as per Condition 11(4) of ECA 5178-9TUPD9.

While moving oil totes at Laydown Area 7 with a Telehandler, the operator punctured a tote of gear oil. The spill duration of 1 minute resulted in approximately 200 L of gear oil spilled to the ground.

The event occurred within the confines of a Laydown area with no impact to any water bodies. Spill pads were used to soak up the spilled oil and the affected ground was scraped up and placed into a contaminated soil bin, with final disposal by contracted hazardous waste management company, Green For Life (GFL).

Figure 1 shows Telehandler puncture in the tote of gear oil.

Dear Mr. Hoffmeister,

RE: 500L Reclaim Water Spill – SAC Reference #5737-AUNLBS

Further to the notification to the Spills Action Centre (SAC) Reference #5737-AUNLBS regarding a spill of reclaim water on January 3, 2018, the following report is submitted to the Ministry of the Environment and Climate Change (MOECC).

Discovery

- A fire alarm was activated in the transfer tower at approximately 0830 hours on January 3, 2018
- Water was found to be escaping the west door of the transfer tower and reporting to a small depression in the ground outside the door.
- This was caused by a pipe associated with the fire suppression system bursting. The fire suppression system is supplied with reclaim water.

Cause

- The dry sprinkler system had activated previously and when the system was reset, all the water did not drain from the system causing a valve to freeze and crack. When the system thawed, the valve that was damaged from the expansion of water freezing began to leak.
- Temperature was -26 degrees Celsius as the time of event.

Clean Up and Recovery

- There was no impact to any water body, water drained to a small depression in the ground.
- Reclaim water did not escape the small depression outside the door.
- The spill was left to freeze in the small excavation and then collected with a loader.
- The material gathered was returned to the mill process.

Preventative Measures

- Standard Operating Procedures (SOP) will be reviewed to include proper drainage of equipment.
- Short term mitigation consisted of placing two (2) sand bag barricades with plastic. Long term mitigation consist of strategically engineered barriers (speed bumps) to be positioned at each door.

Once you have had the opportunity to review this information please feel free to contact the undersigned with any additional questions.

Dear Mr. Hoffmeister,

RE: SAC REF# 5627- AWWVWT HYDROCARBON SPILL AT WAREHOUSE LAYDOWN

In accordance with ECA 5178-9TUPD9, notification was made to the Spills Action Centre (SAC Ref. # 5627-AWWVWT) regarding a 136 L spill of gear lubricant in the laydown yard of the Barron Warehouse on March 16, 2018. The following report is submitted to the Ministry of Environment and Climate Change (MOECC) as per condition 11(4) of ECA 5178-9TUPD9.

Discovery

- During the afternoon of March 16th, warehouse employees were moving 45 gallon barrels of gear lubricant.
- A warehouse employee noticed black viscous hydrocarbon seeping out of bottom of one of the 45 gallon barrels.
- Inspection of the spill area by warehouse supervisor estimated ¾ of the barrel contents had leaked out onto the frozen ground surface.
- The barrel was inverted into a spill tray to stop the leak.
- Employees immediately contained the spill using absorbent pads, booms and sand.
- New Gold Environment was called to inspect the spill.
- The Spills Action Centre was notified at 18:48 hours and an investigation initiated.

Cause

- Puncture of the barrel by one of the forks on the telehandler.
- Secondary containment not in place.

Clean Up and Recovery

- Gear lubricant is composed of 60% asphalt and 40 % petroleum distillates and highly viscous. Spill was fully contained within a 2 m^2 area using pill pads, spill booms and sand.
- Contaminated material was collected in two 45 gallons drums for removal from site by a registered hazardous waste carrier.

Preventative measures and schedule of implementation

- Review with all warehouse employees proper procedures for loading and unloading of barrels containing hydrocarbons and liquids using a telehander before March 31, 2018.
- Establish secondary containment under all containers, barrels, pails that contain hydrocarbons in the laydown area before April 16, 2018
- Maintain minimal quantities of hydrocarbons in the warehouse laydown yard. Expedite shipment to storage areas on site before April 30, 2018.

Should you have any questions after reviewing this letter, please contact the undersigned at (807) 708-2407.

May 02, 2018

Matt Hoffmeister
Senior Environmental Officer
Ministry of the Environment and Climate Change 808 Robertson St.
Kenora, ON P9N 1X9
Via email; Matt.hoffmeister@ontario.ca

Dear Mr. Hoffmeister,

RE: AIR QUALITY EXCEEDANCES OF 24-HOUR TOTAL SUSPENDED PARTICULATE-MONITORING LIMITS - SAC REFERENCE #3444-AY8S75

On April 27, the air quality engineer consultant responsible for reporting the site air quality monitoring results, informed New Gold Environment of elevated laboratory results, indicating total suspended particulates (TSP) and iron exceedances at Gallinger Road air quality station. The consultant stated that these values were uncharacteristically high for this particular location and nearby roadwork activities may have contributed to these results.

New Gold notified the Spills Action Centre (SAC) Reference #3444-AY8S75 of the exceedance of the ministry approved limits for Total Suspended Particulate Matter and Iron (metallic) concentrations on April 27th. The exceedance occurred on March 16, 2018 at the Gallinger Air Quality Monitoring Station, and was reported to New Gold on the 27th of April, as per the procedures. The following letter report accompanies a copy of the notification of exceedance (NOE) as per ECA #0412-A2LR4V.

Gallinger Road air quality station is located approximately 4.5 km due east of the primary crusher on the Rainy River Mine Site. Gallinger Road itself passes by the air quality station in a north-south direction at approximately 50 metres east.

TSP samples were collected during a 24-hr period on March 16, 2018 as per Rainy River Project Ambient Air Quality Monitoring Plan, accepted by MOECC on November 9th, 2016. During this 24-hour period, predominate wind direction varied from east to southeast with an average wind speed of 6 km/hr. The wind direction that day, makes it unlikely that the source of the dust would be coming from the crusher which is situated to the west of the air monitoring station, and suggests that the exceedance was related to the road dust.

newgold™ Rainy River

New Gold's dust abatement plan calls for the application of Calcium Chloride to reduce the road dust. However, one of the requirements for the application of this product, or of the application of water, is that it should not be done under frozen conditions. The spring of 2018 has been dry and cold to date with temperatures well below freezing at night and often during the day until the second week of April. On March 16th, temperatures reached 6°C during daylight hours and dropped to -10°C at night. As such the abatement program could not be implemented at that time due to freezing temperatures at night. No precipitation was recorded during the same 24-hour period making road conditions very dry and prone to dust.

New Gold noticed the above average usage of Gallinger road in early April and reminded staff of the mitigation measures which include restricting access of all motor vehicles along Gallinger Road. On April 15th, New Gold posted managers at the corner of Gallinger and Korpi to stop each driver and remind them personally of the road usage restriction. Traffic on Gallinger was reduced from above 75 vehicles between 6 and 7 am to 3 (non-New Gold) in 5 working days. Physical monitoring will remain in place until the end of May. Mitigation measures including watering of Gallinger Road and placing Calcium Chloride on the road surface to reduce road dust will be applied should dust continue to be an issue

Dear Mr. Hoffmeister,

RE: AIR QUALITY EXCEEDANCES OF 24-HOUR TOTAL SUSPENDED PARTICULATE-MONITORING LIMITS - SAC REFERENCE #3476-AZKQWK

On June 6th, the air quality engineer consultant responsible for reporting the site air quality monitoring results, informed New Gold Environment of elevated laboratory results, indicating total suspended particulates (TSP) and iron exceedances at Gallinger Road air quality station. The consultant stated that these values were higher than normal for this particular location and questioned whether nearby activities contributed to these results.

New Gold notified the Spills Action Centre (SAC) Reference #3476-AZKQWK of the exceedance of the ministry approved limits for Total Suspended Particulate Matter and Iron (metallic) concentrations on June 6th. The exceedance occurred on April 8th, 2018 at the Gallinger Air Quality Monitoring Station, and was reported to New Gold on the 6th of June, as per the procedures. The following letter report accompanies a copy of the notification of exceedance (NOE) as per ECA #0412-A2LR4V.

Gallinger Road air quality station is located approximately 4.5 km due east of the primary crusher on the Rainy River Mine Site. Gallinger Road itself passes by the air quality station in a north-south direction at approximately 50 metres east.

TSP samples were collected during a 24-hr period on April 8th, 2018 as per Rainy River Project Ambient Air Quality Monitoring Plan, accepted by MOECC on November 9th, 2016. During this 24-hour period, predominate wind direction varied from northeast to south-southwest with an average wind speed of 11 km/hr. The wind direction that day, makes it unlikely that the source of the dust would be coming from the crusher which is situated to the west of the air monitoring station, and suggests that the exceedance was related to the road dust.

newgold™ Rainy River

New Gold's dust abatement plan calls for the application of Calcium Chloride to reduce the road dust. However, one of the requirements for the application of this product, or of the application of water, is that it should not be done under frozen conditions. The spring of 2018 has been dry and cold to date with temperatures well below freezing at night. On April 8th, temperatures reached 15.5°C during daylight hours and dropped to -7°C at night. As such the abatement program could not be implemented at that time due to freezing temperatures at night. No precipitation was recorded during the 72-hour period from April 6th to April 8th making road conditions very dry and prone to dust.

As discussed in the air quality exceedance letter report of May 03rd, 2018; New Gold noticed the above average usage of Gallinger road in early April and immediately undertook mitigation measures. Motor vehicle access along Gallinger Road was restricted to local traffic only. On April 15th, New Gold managers, positioned at the corner of Gallinger and Korpi, stopped and reminded each driver of the road usage restriction. Over 5 working days, traffic on Gallinger was reduced from above 15 vehicles between 6 and 7 am to 3 (non-New Gold) vehicles. Physical monitoring continued until the end of May, when all traffic from New Gold had ceased.

New Gold is proceeding with the application of Calcium Chloride along all its roads, including Gallinger. The application should be completed by the end of June.

Once you have had the opportunity to review this document, please contact me at (807) 708-2407 with any questions or concerns.

Dear Mr. Hoffmeister,

RE: AIR QUALITY EXCEEDANCES OF 24-HOUR TOTAL SUSPENDED PARTICULATE-MONITORING LIMITS - SAC REFERENCE #3476-AZKQWK

On June 6th, the air quality engineer consultant responsible for reporting the site air quality monitoring results, informed New Gold Environment of elevated laboratory results, indicating total suspended particulates (TSP) and iron exceedances at Gallinger Road air quality station. The consultant stated that these values were higher than normal for this particular location and questioned whether nearby activities contributed to these results.

New Gold notified the Spills Action Centre (SAC) Reference #3476-AZKQWK of the exceedance of the ministry approved limits for Total Suspended Particulate Matter and Iron (metallic) concentrations on June 6th. The exceedance occurred on April 8th, 2018 at the Gallinger Air Quality Monitoring Station, and was reported to New Gold on the 6th of June, as per the procedures. The following letter report accompanies a copy of the notification of exceedance (NOE) as per ECA #0412-A2LR4V.

Gallinger Road air quality station is located approximately 4.5 km due east of the primary crusher on the Rainy River Mine Site. Gallinger Road itself passes by the air quality station in a north-south direction at approximately 50 metres east.

TSP samples were collected during a 24-hr period on April 8th, 2018 as per Rainy River Project Ambient Air Quality Monitoring Plan, accepted by MOECC on November 9th, 2016. During this 24-hour period, predominate wind direction varied from northeast to south-southwest with an average wind speed of 11 km/hr. The wind direction that day, makes it unlikely that the source of the dust would be coming from the crusher which is situated to the west of the air monitoring station, and suggests that the exceedance was related to the road dust.

newgold™ Rainy River

New Gold's dust abatement plan calls for the application of Calcium Chloride to reduce the road dust. However, one of the requirements for the application of this product, or of the application of water, is that it should not be done under frozen conditions. The spring of 2018 has been dry and cold to date with temperatures well below freezing at night. On April 8th, temperatures reached 15.5°C during daylight hours and dropped to -7°C at night. As such the abatement program could not be implemented at that time due to freezing temperatures at night. No precipitation was recorded during the 72-hour period from April 6th to April 8th making road conditions very dry and prone to dust.

As discussed in the air quality exceedance letter report of May 03rd, 2018; New Gold noticed the above average usage of Gallinger road in early April and immediately undertook mitigation measures. Motor vehicle access along Gallinger Road was restricted to local traffic only. On April 15th, New Gold managers, positioned at the corner of Gallinger and Korpi, stopped and reminded each driver of the road usage restriction. Over 5 working days, traffic on Gallinger was reduced from above 15 vehicles between 6 and 7 am to 3 (non-New Gold) vehicles. Physical monitoring continued until the end of May, when all traffic from New Gold had ceased.

New Gold is proceeding with the application of Calcium Chloride along all its roads, including Gallinger. The application should be completed by the end of June.

Dear Mr. Hoffmeister,

RE: 20L Process Water Spill – SAC Reference #2021-B46NNP

On August 31st at approximately 1200, process water was found to be backing up into the Millwright shop from the mill floor. This water was found to have escaped the man door of the Millwright shop and made contact with the ground outside the mill. (See photo below)

The mill was in upset conditions which caused a great deal of process slurry to settle in the works. When the mill was restarted various filter screens, cyclones and sumps were clogged and overtopped onto the mill floor. The process water separated from the slurry and backed up into the Millwright shop then spilled out door 11E. There was no impact to any water body as the process water only migrated about 5 meters outside the door resulting in 20L exiting the mill.
This spill was caught quickly by the operators and work ceased. The gravel containing the process water was placed inside the mill and returned into the process, this was completed by the end of the day shift.

Changes will be made to the mill start up procedure to include monitoring and mitigating the level of process water on the mill floor in the interim. In the longer term, work continues within the mill to ensure proper sloping is in place to direct any process water/slurry to internal sumps.

Once you have had the opportunity to review this information please feel free to contact the undersigned or Sylvie St.Jean (at Sylvie.St.Jean@newgold.com or 807-707-3497) with any additional questions.

Regards,

Dear Mr. Hoffmeister,

RE: 1000L Tailings Spill – SAC Reference #3763-B4KHDD

On September 13th at approximately 1215 am, tailings was found to be exiting door 3N from the tailings sump pump box and migrated 55 meters to the northeast. See photo below (clean-up was well underway at time of photo)

The spill only lasted a few minutes and quick action by the operators placing sand over the existing berm (speed bump) in front of door 3N stopped 80-90% of the tails from escaping. See photo below.

New Gold Inc., Rainy River Project
5967 Highway 11/71, P.O. Box 5
Emo, ON P0W 1E0

T 807-482-0900
F 807-482-2834
www.newgold.com

Clean-up began right away and finished around 5 pm that day. There was no impact to any water body and all contaminated materials were collected and put back into the mill process.

The cause of this event was a combination of power failures along with process software updates which caused upset conditions in the mill, resulting in failed alarms and pumps operating incorrectly. An internal investigation is on-going.

Once you have had the opportunity to review this information please feel free to contact the undersigned or Sylvie St. Jean (at Sylvie.St.Jean@newgold.com or 807-707-3497) with any additional questions.

Dear Mr. Hoffmeister,

RE: 450L Dyed Diesel Spill Drill 903 – SAC Reference #5120-B7MMFB

At 0300 hours the operator of drill 903 noticed an unexpected drop in fuel level well drilling blast holes in the East Outcrop. (See photo 1 below)

Photo 1: Map of site denoting spill location.

Photo 2: Drill 903

The operator called maintenance for assistance and dismounted to look for a leak. He discovered that he had backed over a large rock and punctured the fuel tank, he then moved the drill off the rock and tilted the drill back to mitigate further spillage (as can be seen in photo 2 above).

At surface, the spill did not appear to be significant but upon further inspection it was noticed that a large amount of fuel had seeped into the shattered rock (see photos 3 and 4 below). Three drill holes were found to be contaminated with dyed diesel.

Photo 3: Spill site

Photo 4: Drill hole

By mid-day a vacuum truck had collected as much fuel as possible from the drill holes and placed it in used oil totes for pick up by Green For Life, a licensed hazardous waste disposal company.

The blasting agent used on site is an emulsion product that contains a significant component of diesel. It is expected that when these holes are loaded and blasted most, if not all, of the residual diesel will be consumed. This will occur by mid-January. At that time the rock will be inspected for contamination.

If the rock is found to be contaminated, it will be sent through the mill as a treatment. If the rock is found to be clean, it will be used onsite to build required infrastructure.

Once you have had the opportunity to review this information please feel free to contact the undersigned or Sylvie St.Jean (at Sylvie.St.Jean@newgold.com or 807-707-3497) with any additional questions.

Dear Mr. Hoffmeister,

RE: 450L Propylene Glycol Spill - SAC Reference #7150-AY33FE

Further to the notification to the Spills Action Centre (SAC) Reference #7150-AY33FE regarding a spill of propylene glycol on April 21st , 2018, the following report is submitted to the Ministry of Environment and Climate Change (MOECC).

Discovery

- Loader operator went to remove a partially emptied tote of propylene glycol while completing cleanup duties at the end of his shift on the TMA North Dam.
- When attempting to pick up the tote, he discovered the loader forks had punctured the plastic tote.
- The operator immediately called his supervisor and stopped all work in the affected area.

Cause

- Puncturing the base of the plastic tote caused the contents to spill onto the ground surface.
- Loader operator performed the task alone without authorization from Supervisor.

Clean Up and Recovery

- Approximately 450 liters of propylene glycol spilled onto the downstream sand seam of TMA North Dam where it was 100% contained. There was no impact to any nearby water sources.

- An estimated 7 m^3 of contaminated sand was scraped up and loaded into a contaminated soil bin.
- Spill pads and boom socks, used during the containment and clean-up process, were collected into barrels.
- Contaminated materials, removed from the immediate area, are stored in a laydown area; awaiting removal from site by a registered hazardous waste carrier.

Preventative Measures

- Implement re-training with team members to understand the importance of a using a spotter when performing all tasks with limited visibility.
- Increase supervisor participation with crews in work areas and reviewing task assignments.

Once you have had the opportunity to review this information, please feel free to contact the undersigned or Sylvie St. Jean at (sylvie.st.jean@newgold.com or 807-707-3497) with any additional questions you may have.

Dear Mr. Hoffmeister,

RE: AIR QUALITY EXCEEDANCES OF 24-HOUR TOTAL SUSPENDED PARTICULATE-MONITORING LIMITS - SAC REFERENCE #3444-AY8S75

On April 27, the air quality engineer consultant responsible for reporting the site air quality monitoring results, informed New Gold Environment of elevated laboratory results, indicating total suspended particulates (TSP) and iron exceedances at Gallinger Road air quality station. The consultant stated that these values were uncharacteristically high for this particular location and nearby roadwork activities may have contributed to these results.

New Gold notified the Spills Action Centre (SAC) Reference #3444-AY8S75 of the exceedance of the ministry approved limits for Total Suspended Particulate Matter and Iron (metallic) concentrations on April 27th. The exceedance occurred on March 16, 2018 at the Gallinger Air Quality Monitoring Station, and was reported to New Gold on the 27th of April, as per the procedures. The following letter report accompanies a copy of the notification of exceedance (NOE) as per ECA #0412-A2LR4V.

Gallinger Road air quality station is located approximately 4.5 km due east of the primary crusher on the Rainy River Mine Site. Gallinger Road itself passes by the air quality station in a north-south direction at approximately 50 metres east.

TSP samples were collected during a 24-hr period on March 16, 2018 as per Rainy River Project Ambient Air Quality Monitoring Plan, accepted by MOECC on November 9th, 2016. During this 24-hour period, predominate wind direction varied from east to southeast with an average wind speed of 6 km/hr. The wind direction that day, makes it unlikely that the source of the dust would be coming from the crusher which is situated to the west of the air monitoring station, and suggests that the exceedance was related to the road dust.

newgold™ Rainy River

New Gold's dust abatement plan calls for the application of Calcium Chloride to reduce the road dust. However, one of the requirements for the application of this product, or of the application of water, is that it should not be done under frozen conditions. The spring of 2018 has been dry and cold to date with temperatures well below freezing at night and often during the day until the second week of April. On March 16th, temperatures reached 6°C during daylight hours and dropped to -10°C at night. As such the abatement program could not be implemented at that time due to freezing temperatures at night. No precipitation was recorded during the same 24-hour period making road conditions very dry and prone to dust.

New Gold noticed the above average usage of Gallinger road in early April and reminded staff of the mitigation measures which include restricting access of all motor vehicles along Gallinger Road. On April 15th, New Gold posted managers at the corner of Gallinger and Korpi to stop each driver and remind them personally of the road usage restriction. Traffic on Gallinger Road was reduced from more than 15 vehicles travelling between 6 and 7 am to zero New Gold employees using the road in 5 working days. Physical monitoring will remain in place until the end of May. Mitigation measures including watering of Gallinger Road and placing Calcium Chloride on the road surface to reduce road dust will be applied should dust continue to be an issue.

Once you have had the opportunity to review this document, please contact me at (807) 708-2407 with any questions or concerns.

RE: 2018 ESA Acoustic Audit – Exceedance of Sound Threshold

Dear Mr. Vandenbroeck,

Consistent with Endangered Species Act (ESA) Permit FF-C-001-14 condition 4.1 and 4.2 New Gold Inc (New Gold) is providing notification to the Ministry of Natural Resources and Forestry (MNRF) that sound threshold was exceeded during the ongoing acoustic audit. However, the source of noise resulting in the exceedance appears unrelated to construction or operations activities and as such no immediate mitigation is proposed.

Preliminary results received from sound recording equipment on May 1st and May 3rd exceeded the 50 dBA sound level threshold;

- At 0300 on May 1, 2018, monitoring equipment recorded sound levels of 61 dBA at the North Receptor Habitat and 60 dBA at the South Receptor Habitat. Recorded sound levels were almost identical indicating a global source, such as a thunderstorm. This exceedance was weather related, not produced by construction activities. Please refer to attached sound files NRM 05.01.2018.3AM and SRM05.01.2018.3AM.

- At 2100 on May 2, 2018, monitoring equipment recorded sound levels of 52 dBA at the North Receptor Habitat. A review of the audio recordings found wildlife activities (birds chirping, frogs croaking) overprinting intermittent equipment noise. Please refer to attached sound file SR62.

These occurrences appear isolated and related to natural phenomena, not construction or operation activities. Therefore, implementation of immediate mitigations measures related to operations or construction activities stipulated in condition 4.1 is not proposed at this time.

New Gold Inc.

Via email; Matt.hoffmeister@ontario.ca

Dear Mr. Hoffmeister,

RE: - SAC REFERENCE #0415-AYR2B6

On May 13, a Mill Supervisor informed New Gold Environment of a spill beside the Lime Silo on the northeast side of the mill process building. Initial reports estimated that 1,000 kg of granular High Calcium Quicklime was spread across the ground surface between the mill and silo.

New Gold notified the Spills Action Centre (SAC) Reference #0415-AYR2B6 of the reportable spill as defined in Ontario Regulation 675/98, condition 11(4) of Environmental Compliance Approval No. 5178-9TUPD9 and the internal spill reporting procedure. The estimated amount of the spill exceeded the Federal Transportation of Dangerous Good (TDG) Act Schedule 1 approved limits of 5 kg for Class 8, Corrosive substances. TDG Act classifies Lime as a Class 8 substance.

During the regular unloading process, a contractor supplied delivery hose was connected between the tanker truck and lime silo. Compressed air, used to move the granular lime from the tanker truck to the silo, blew lime out of a rupture in the delivery hose and covered the ground around mill doors 8e and 9e and the Lime silo. West Creek Diversion, the closest fish bearing waterbody located approximately 300 m north of the lime silo, was not impacted. Reclamation trial berms and natural ground contours north of the mill process building provide a natural barrier to any offsite movement of deleterious substances. During this 24-hour period, predominate wind direction was from northeast with an average wind speed of 19 km/hr. Wind direction and speed at the time of the event, confined the spill to a 10 m^2 radius between the lime silo, mill building and tanker truck.

New Gold Inc.
Rainy River Mine
5967 HWY 11/71, P.O. Box 5
Emo, ON P0W 1E0

T 807-482-2501
F 807-482-2834
www.newgold.com

newgold™ Rainy River

Further investigation of the event confirmed that initial reports of the spill quantity were overestimated. In total, only 26 kg of High Calcium Quicklime was lost during the rupture of the delivery hose. Cleanup of the affected area was completed before midnight on May 13, 2018. Granular Quicklime and gravel were collected by a mini Bobcat and placed into the Mill for disposal.

New Gold will be implementing preventative measures to ensure this type of event does not reoccur. These measures include immediate replacement of the delivery hose by the contractor. Going forward, all contractors providing delivery and unloading of Quicklime will be required to provide inspection reports of the delivery hose and delivery system. Reports will be reviewed and signed off by New Gold Mill Supervisor before unloading. Defective hoses will be tagged and removed from the site by the contractor. Additional mitigation measures include the mandatory use of spill trays at the connection points to capture any spillage.

Once you have had the opportunity to review this document, please contact me at (807) 708-2407 with any questions or concerns.

Regards,

Dear Mr. Hoffmeister,

RE: 3000 L Hydraulic Fluid Spill - SAC Reference #2600-AZ2V8F

Further to the notification to the Spills Action Centre (SAC) Reference #2600-AZ2V8F regarding a spill of hydraulic fluid on May 23rd, the following report is submitted to the Ministry of Environment and Climate Change (MOECC) as per condition 11(4) of ECA 5178-9TUPD9.

Discovery

- During routine removal of ore, a PC5500 Komatsu Shovel (unit number 603) lost power to the boom arm.
- The operator then shut the shovel down, noticed the leaking hydraulic fluid and called the Mine Shift Supervisor to inform him of the situation and request a clean-up crew.

Cause

- A rupture in the hydraulic line caused 3,000 litres of hydraulic fluid to flow onto the rocky surface of the open pit.
- The line had failed in the past, but had been patched and a replacement line was on order.

Clean Up and Recovery

- The event occurred within the confines of the open pit with no impact to any water bodies.
- Due to the speed at which the leak occurred, a berm was immediately built to contain and stop the hydraulic fluid from spreading.
- The hydraulic fluid did not penetrate into the ground, as the area is composed of blast rock sitting atop bedrock.
- Green for Life (GFL) arrived on site with a vacuum truck to remove the spilled hydraulic fluid from the pit floor.
- GFL removed approximately 13,500 litres of contaminated hydraulic fluid, water and mud. The vacuum truck transported the contaminated waste back to Thunder Bay for proper disposal.
- All contaminated rock remaining on the pit floor was cleaned, then processed through the primary crusher into the mill.
- Contaminated spill pads, booms and brooms were collected, then placed in appropriate containers and stored at the plant site truck shop for pick up by GFL.

Preventative Measures

- Effective immediately, patched hydraulic hoses will no longer be used under any circumstances.
- The New Gold Mobile Maintenance standard operating procedure (MOP-SOP-0011) will be updated to incorporate this change.

Once you have had the opportunity to review this information, please feel free to contact the undersigned or Sylvie St.Jean (at Sylvie.St.Jean@newgold.com or 807-707-3497) with any additional questions you may have.

Regards,

Via email: Matt.Hoffmeister@ontario.ca

Dear Mr. Hoffmeister,

RE: 300L Process Water Spill - SAC Reference #3476-AZKQWK

Further to the notification to the Spills Action Centre (SAC) Reference #3476-AZKQWK regarding a process water spill on June 9th, the following report is submitted to the Ministry of Environment and Climate Change (MOECC) as per condition 11(4) of ECA 5178-9TUPD9.

Discovery

- During regular operation of the Mill, an employee discovered process water spilling over from the carbon collection tank, flooding the secondary containment area, flowing into the truck ally then exiting out Door 8E.
- Transfer of carbon and excess process water immediately ceased.

Cause

- The carbon safety screen plugged causing the carbon collection tank to fill with a mixture of carbon, slurry and process water.
- A sump pump situated in the collection tank was disconnected and failed to activate.
- Mill doors remain open to provide additional ventilation during summer operations.

Clean Up and Recovery

- The event occurred within the immediate area of the mill process building and Door 8E access with no impact to any water bodies.

- An estimated 300L of process water was lost during the event. Only 76L left the building and spilled outside onto the gravel surface within a 20 meter radius of Door 8E.
- Pooled water near Door 8E was pushed back into the mill. A sandbag berm barrier was constructed to stop flow of water outside of the building.
- Gravel saturated by the spill was dug up and placed inside the mill for processing.

Preventative Measures

- A sump collection project has been approved and will be constructed during June, 2018.
- Sandbag barriers and water collection berms will remain in place until then.

Once you have had the opportunity to review this information, please feel free to contact the undersigned or Sylvie St.Jean (Sylvie.St.Jean@newgold.com or 807-707-3497) with any additional questions you may have.

Regards,

Dear Mr. Vandenbroeck,

RE: 2018 ESA Acoustic Audit – Exceedance of Sound Threshold

As per Endangered Species Act (ESA) Permit FF-C-001-14 conditions 4.1 (g) and 4.2 (b), New Gold is providing notification to the Ministry of Natural Resources and Forestry (MNRF) that sound level thresholds were exceeded during the ongoing acoustic audit. However, the source of noise resulting in the exceedance appears unrelated to construction or operations activities and no immediate mitigation is proposed.

Preliminary results received from sound recording equipment on June 6, 2018 exceeded the 50 dBA sound level threshold:

- Between 11:00 and 13:00 hours on June 6, 2018, monitoring equipment recorded sound levels of 51 and 51 dBA at the North Receptor Habitat also 51 and 52 dBA at the South Receptor Habitat. Recorded sound levels indicate that the exceedances were weather related, likely due to strong winds. Please refer to attached sound files NRM June.06.2018_1120-1130, NRM June.06.2018_1234-1244, SRM June.06.2018_1120-1130, and SRM June.06.2018_1311-1321.

As per ESA Permit conditions 4.1 (g) and 4.2 (b), acoustic audit measurements in the North and South EWPW Receptor Habitat areas were completed on June 7, 2018.

Please contact me with any questions or concerns at (807) 708-2407.

Best Regards,

Dear Mr. Hoffmeister,

RE: TAILINGS SLURRY SPILL 8L - SAC REFERENCE #1728-AZUQ67

On June 15, a contract employee called his area manager at 18:00 hours to inform him of a leak on a fusion coupling on the tailing corridor line at the curve, due north of where the line passes under Roen Road, west of the Marr site. The mill crew had previously completed a visual inspection of the entire tailings line at 17:30 hours and did not report any irregularities. Spray from the leak was covered by a spill tray held in place with a wooden pallet to prevent spreading by evening wind. The mill was shut down and a vacuum truck mobilized onto site to initiate cleanup. New Gold Environment Manager was informed at 20:51 hours and visited the area to assess the spill at 22:00 hours. At that time, it was observed that the Tailings slurry had leaked into the secondary containment area, with some material accumulated on the berm. Clean up continued during the night. A vacuum truck removed slurry from the containment area and disposed of it in Cell 2 of the Tailings Management Area (TMA).

During the morning of June 16th, a New Gold Environmental Technician went out to inspect the cleanup efforts and noticed that approximately 8 L of Tailings Slurry had sprayed over the containment berm onto vegetation. Immediately, the area manager was contacted to organize another cleanup. A vacuum truck returned to site and removed the Tailings Slurry, contaminated vegetation and topsoil in the spill area. Slurry and contaminated vegetation/topsoil mixture were disposed of into Cell 2 of the TMA.

The New Gold internal Environmental Standard Operating Procedure (ENV-SOP-0002) states all Tailings Slurry spills are to be externally reported.

Notification was made to the Ministry of the Environment and Climate Change as well as to the Spills Action Centre (SAC) (Reference #1728-AZUQ67) as defined in Ontario Regulation 675/98, condition 11(4) of Environmental Compliance Approval No. 5178-9TUPD9 and the above cited internal spill reporting procedure.

New Gold has implemented preventative measures to ensure this type of event does not reoccur. These measures include removal of the leaking fusion coupling and replacement with a flanged coupling.

Once you have had the opportunity to review this document, please contact me at (807) 708-2407 with any questions or concerns.

Regards,

Dear Mr. Hoffmeister,

RE: 115L Hydraulic Fluid Spill – SAC Reference #8246-B2PV5U

Further to the notification to the Spills Action Centre (SAC) Reference #8246-2PV5U regarding a spill of hydraulic fluid on July 15, 2018, the following report is submitted to the Ministry of the Environment, Conservation and Parks (MOECP) as per Condition 11(4) of ECA 5178-9TUPD9.

Discovery

- While loading clay into a rock truck, a Komatsu PC650 excavator (unit #653) had a hydraulic line failure (Photo 1).
- The operator shut down the equipment when the line had failed, deployed a spill kit kept in the excavator, and notified the Contractor supervisor and Contractor HSE advisor.

Cause

- A suspected defective hose caused the failure of the hydraulic line resulting in 115 litres of hydraulic fluid spilling to the ground at a clay borrow pit within the footprint of the Tailings Management Area (TMA) (Map 1).

Clean Up and Recovery

- The event occurred within the confines of a clay borrow pit in the TMA footprint, with no impact to any water bodies.
- The hydraulic fluid did not penetrate into the ground, as the spill occurred in a clay borrow pit.
- A spill kit kept in the equipment was deployed by the operator.
- The affected clay was scraped up by bulldozer (Photo 2), loaded into a rock truck and transported to a contaminated soil bin for pick up and proper disposal by the Contractor's hazardous waste management company, Asselin Transportation. The used spill kit materials were deposited in a hazardous waste bin for pick up and proper disposal by Asselin Transportation.

Preventative Measures

- A daily machine inspection was completed and no leaks were observed at the start of shift. Daily inspections and regular maintenance are required by New Gold for all mobile equipment.

Please feel free to contact the undersigned or Sylvie St. Jean (Sylvie.St.Jean@newgold.com or 807-707-3497) with any questions.

Kind Regards,

Dear Mr. Hoffmeister,

RE: PROCESS WATER SPILL 57L - SAC REFERENCE #2504-B3TQR2

During the early morning hours on August 20, while checking a pump and hose line into the secondary containment area around the thickener and leach tanks, a mill employee discovered the line laying on the ground and process water flowing into the truck alleyway in front of Door 18W (Photo 1). Mill Door 18W is located on the west side of the process building, adjacent to the thickener and leach tank secondary containment area.

Photo 1. Extent of process water spill into truck alleyway of Door 18W.

New Gold Inc.
Rainy River Mine
5967 HWY 11/71, P.O. Box 5
Emo, ON P0W 1E0

T 807-482-2501
F 807-482-2834
www.newgold.com

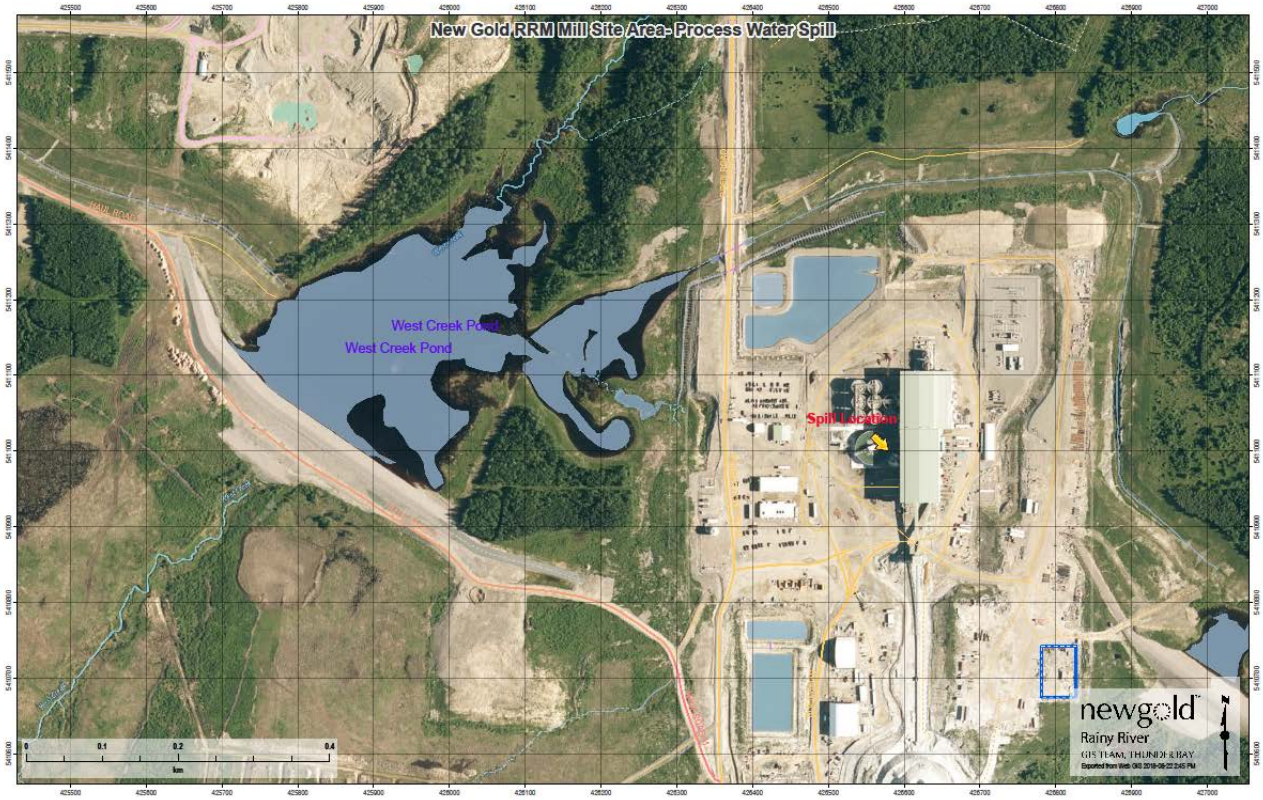

Photo 2. New Gold Rainy River Mine Process Plant site. Spill location denoted in red.

The pump was immediately shut off. Approximately 57L of process water ponded within 25 meters of the door, where it was 100% contained. Mill Door 18W is located 300 to 400 m west of the West Creek Pond and Diversion waterway (Photo 2). Natural topography and man-made features prevented the spill from reaching any further than the alleyway.

At that time of the event, it was observed that the green hose line connected to the pump and positioned over the wall into the containment area was too short. When the pump surged, the force knocked the line back over the wall and onto the ground surface. The green hose line was replaced with a longer black hose line which reached onto the containment area floor (Photo 3).

Photo 3. Black replacement hose on floor of containment area. Green hose line along containment wall.

Spill clean-up of the alleyway took place in the afternoon. Ponded process water and mud was scraped up and deposited into the thickener secondary containment area, where it washed into a floor sump back through the plant. Clean up was completed by 18:00 hours on August 20th (Photo 4).

The New Gold Internal Environmental Standard Operating Procedure (ENV-SOP-0002) states all Process water spills exceeding 25L are to be externally reported.

Notification was made to the Ministry of the Environment, Conservation and Parks as well as to the Spills Action Centre (SAC) (Reference #2504-B3TQR2) as defined in Ontario Regulation 675/98, condition 11(4) of Environmental Compliance Approval No. 5178-9TUPD9 and the above cited internal spill reporting procedure.

Photo 4. Alleyway of Door 18W showing the area after cleaned up was completed.

Dear Mr. Hoffmeister,

RE: VULTREX GEAR LUBRICANT 100L SPILL - SAC REFERENCE #3400-B4PU2N

During the night of September 15, a short and intense storm deposited 29.8 mm of precipitation over the plant site area within a 5-hour period. Precipitation from this storm temporarily overwhelmed the capacity of the east plant site drainage system, located along the toe of the upper bench due east of the mill process building. Run-off water migrated into a laydown area between the mill storage tent and propane tank, which was used to store hydrocarbon totes and barrels. The force of water flowing through the drainage system partially eroded the base under a secondary containment tub which supported a 1000L tote of Vultrex gear lubricant (Photo 1). The tote slid off the secondary containment tub and tipped over, dislodging the bung allowing 100L of gear lubricant to escape onto ground surface (Photo 2).

Photo 1. Tote of Vultrex Gear Lubricant supported on secondary containment tub.

New Gold Inc.
Rainy River Mine

Emo, ON P0W 1E0

T 807-482-2501
F 807-482-2834
www.newgold.com

Photo 2. Extent of the gear oil spill into laydown area east of Mill Process building.

The spill occurred approximately 100 m east of mill process building in a laydown area which borders the plant site east drainage ditch system. Runoff water collects in the ditch and is channeled south through the site into the South Pond (Photo 3). All runoff water from the spill area was contained by this internal drainage system the South Pond. Water from the South Pond is used by the mill for processing ore. Any overflow is routed to the Mine Rock Pond via a 20-inch pipeline. New Gold will monitor the South Pond for evidence of hydrocarbon sheen.

Photo 3. GIS image of spill area (pink) and location of contact water drainage ditch (blue hatch).

Photo 4. View of area after cleaned up was completed.

Once all totes and barrels were removed from the area, a skid steer loader was utilized to remove all the hydrocarbon contaminated clays, gravels and vegetation. Contaminated materials were loaded into a 20 yd^3 contaminated soil bin for disposal at the Richardson Landfill. Clean up efforts commenced on Monday, September 16 and were completed by Thursday, September 20, 2018 (Photo 4).

Corrective actions include establishing a new hydrocarbon laydown area on the plant site upper east bench. The laydown will contain a clay and gravel lined secondary containment area used for storage of totes and barrels containing hydrocarbons. All totes/barrels stored outside the secondary containment area will be placed on yellow secondary containment tubs. Construction is scheduled to commence during the week of October 01 – 04, 2018.

Notification was made to the Ministry of the Environment, Conservation and Parks as well as to the Spills Action Centre (SAC) (Reference #3400-B4PU2N) as defined in Ontario Regulation 675/98, condition 11(4) of Environmental Compliance Approval No. 5178-9TUPD9 and in the New Gold Internal Environmental Standard Operating Procedure (ENV-SOP-0002).

Once you have had the opportunity to review this document, please contact me at (807) 708-2407 with any questions or concerns.

Dear Mr. Hoffmeister,

RE: TREATED TAILINGS 30L SPILL - SAC REFERENCE # 5504-BFXLNJ

Further to the notification to the Spills Action Center (SAC) Reference # 5504-BFXLNJ, on November 27, 2018 at 16:33, a tailings line corridor inspection at Emergency Dump Pond #6 noted a tailings line leak at a previously patched line of pipe. The mill was contacted, and shutdown began to take place at 16:36. The treated tailings started to spray onto the access road as the mill commenced shutdown.

Figure 1 shows tailings leak location at 16:50. Tailings spilled onto access road to Emergency Dump Pond 6. Tailings also pooling inside containment due to ice build under WMP reclaim line.

Once the tailings line was depressurized, the previous sleeve patch was inspected, adjusted, and retightened to stop the leak. More spigots were opened to reduce pressure on the tailings line and frequency of inspections increased through out the evening, to ensure the sleeve patch held.

New Gold Inc.
Rainy River Mine
5967 HWY 11/71, P.O. Box 5
Emo, ON P0W 1E0

T 807-482-2501
F 807-482-2834
www.newgold.com

Figure 2 shows where the tailings sprayed out of the sleeve patch (lighter grey area along pipe) and ice build-up within the tailings corridor containment as a result of the spill.

Clean up began the morning of November 28, 2018 once the treated tailings froze. This allowed for the equipment to scrape up the spill without fear of the tailings flowing away from the impacted area. 1m^3 of frozen tailings and contaminated material was removed from the location.

Figure 3 Shows removal of tailings and contaminated material as well as recapped road once clean-up was complete.

The new tailings pipe section is planned to be installed during a maintenance shutdown for the mill. This portion of pipe will be put together in the maintenance shop and fused during the shutdown. In the interim, a portion of belt will be used to cover the sleeve patch and monitored during dayshift and nightshift. The drain to Emergency Dump Pond #6 will also be maintained free of ice to allow drainage in case of emergency.

Figure 4 shows Allmond heater and insulated tarp being used to thaw the frozen tailings from the bottom of the containment as well as thaw ice dam underneath WMP Reclaim line.

Once you have had the opportunity to review this information please feel free to contact the undersigned or Sylvie St. Jean (at Sylvie.St.Jean@newgold.com or 807-707-3497) with any additional questions.

Dear Mr. Hoffmeister,

RE: Tailings Dusting Event – SAC Reference #2502-B6RUM5

On November 22, 2018 a fugitive dust event was reported coming off of the Cell 1 pond in the Tailings Management Area at approximately 14:00 (See photo 1).

Photo 1: Tailings dust from Cell # 1

Winds were gusting up to 35 km/h out of the south and it was evident at the time that the plume was travelling outside of the Environmentally Sensitive Area (ESA) boundary. Samples of snow were taken from Cell 1 north dam and from the northern most tip of the ESA boundary to assess the level of impact. (See Photo 2).

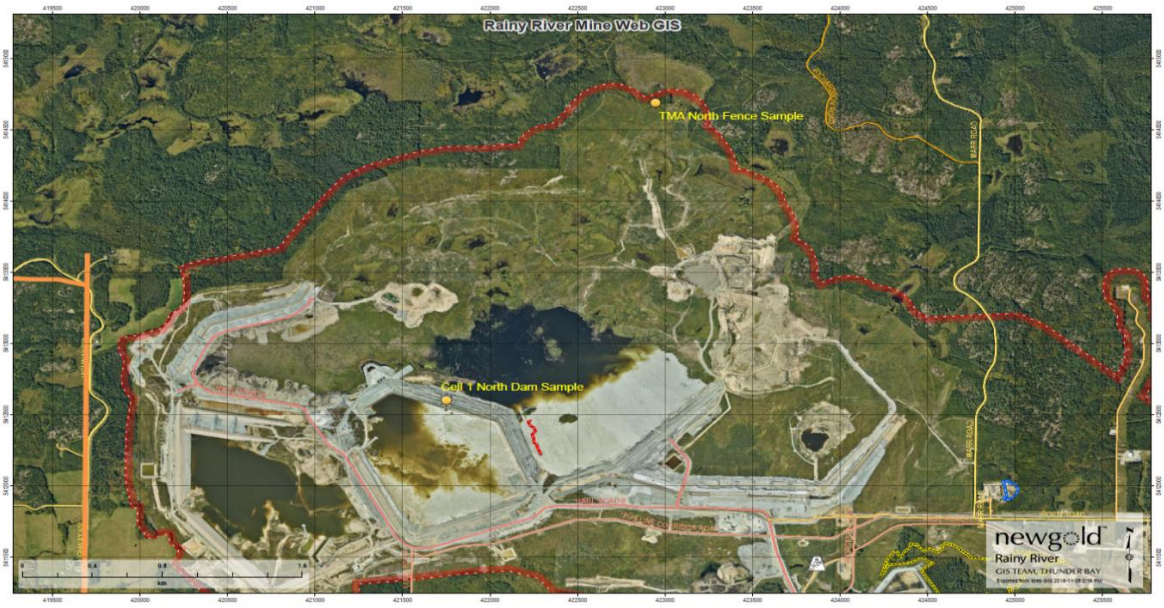

Photo 2: Map showing ESA Boundary

The samples taken were analyzed by ALS Environmental Laboratories in Thunder Bay, indicate there was little to no impact at that time. Tests show the three most prevalent elements on Cell 1 dam to be calcium, iron and sulfur at 38,200 mg/L, 10,600 mg/L and 17,300 mg/L, respectively. Tests results from the TMA North Fences samples showed levels of these elements to be lower by a factor of one thousand times or more (See appendix A).

The following day the weather conditions improved, and no fugitive dust event was seen at that time. However, from November 24th onwards moderate to high winds have persisted from the northwest and the dusting event is continuing at varying intensities. On Sunday November 26th, New Gold updated the Spills Action Center with this information.

New Gold began taking steps to control the fugitive dust on November 23rd which included adding water to Cell 1 in an effort to cover the exposed tailings and installing sprinklers along the banks of Cell 1 to form an ice sheet to keep the dust down. Several other options are currently being investigated in order to find a more permanent solution to the fugitive dust issue.
One option is to cover the exposed tailings with a product known as soil cement to provide a final cap. The soil cement requires constant reapplication, as rain will dilute it and the winter application contains glycerin which would be difficult to treat.
A second option is to apply a mix of hay, overburden and PAG/waste rocks to the exposed tailings. This solution is the most favorable, as it would promote vegetation growth and stabilize the material until subsequent lift will overprint it. Overburden cover should commence when the tailings are frozen enough to support a 40t truck (wiggle wagon).

If you have any further questions, please contact the undersigned.

Respectfully submitted,

Dear Sir,

VIBRATION COMPLAINT – SAC# 3165-B4XRMG

On September 25, 2018 at 1:07 pm New Gold Rainy River Project (RRP) Community Relations received a complaint regarding vibrations felt from a blast on the New Gold Rainy River Project site on Wednesday, September 25 at 11:00 am. As per ECA #0412-A2LR4V terms and conditions section 7.1 and 7.2 please accept this letter as notification;

a) Message from Lisa Teeple stated that the blast caused the floor in the shop, situated 300 ft west of the house, to lift and crack. House and shop are located approximately 2.3 km south-southwest from the blast source. See attached map for reference.

b) A blast was detonated at approximately 11:00 am, September 25, 2018 in the New Gold RRM East Mine Rock Stockpile drainage ditch area, located approximately 3.2 km southeast of the RRM open pit center.

c) Climatic conditions at the time were wind direction 309 degrees (northwest), wind speed 11 km/hr., average relative humidity 83%, average temperature 7.3 degrees C., with cloudy and overcast skies.

d) Ginger Bragg, Supervisor for New Gold RRM Community Relations, received the complaint shortly after the blast.

e) New Gold RRM community personnel communicated to the neighbors and Chapple township that blasting would take place in this area for a period of 8 weeks, from September to October of 2018. Vibration and concussion (air overpressure) readings monitored at 6 locations did not exceed Ministry Publication NPC-119 cautionary values of 10 mm/s and 120 dB respectively.

Vibration and Overpressure Monitoring Stations for Sep 25, 2018

Dear Mr. Hoffmeister,

RE: SAC REF# 5627- AWWVWT HYDROCARBON SPILL AT WAREHOUSE LAYDOWN

In accordance with ECA 5178-9TUPD9, notification was made to the Spills Action Centre (SAC Ref. # 5627-AWWVWT) regarding a 136 L spill of gear lubricant in the laydown yard of the Barron Warehouse on March 16, 2018. The following report is submitted to the Ministry of Environment and Climate Change (MOECC) as per condition 11(4) of ECA 5178-9TUPD9.

Discovery

- During the afternoon of March 16th, warehouse employees were moving 45 gallon barrels of gear lubricant.
- A warehouse employee noticed black viscous hydrocarbon seeping out of bottom of one of the 45 gallon barrels.
- Inspection of the spill area by warehouse supervisor estimated ¾ of the barrel contents had leaked out onto the frozen ground surface.
- The barrel was inverted into a spill tray to stop the leak.
- Employees immediately contained the spill using absorbent pads, booms and sand.
- New Gold Environment was called to inspect the spill.
- The Spills Action Centre was notified at 18:48 hours and an investigation initiated.

Cause

- Puncture of the barrel by one of the forks on the telehandler.
- Secondary containment not in place.

Clean Up and Recovery

- Gear lubricant is composed of 60% asphalt and 40 % petroleum distillates and highly viscous. Spill was fully contained within a 2 m^2 area using pill pads, spill booms and sand.
- Contaminated material was collected in two 45 gallons drums for removal from site by a registered hazardous waste carrier.

Preventative measures and schedule of implementation

- Review with all warehouse employees proper procedures for loading and unloading of barrels containing hydrocarbons and liquids using a telehander before March 31, 2018.
- Establish secondary containment under all containers, barrels, pails that contain hydrocarbons in the laydown area before April 16, 2018
- Maintain minimal quantities of hydrocarbons in the warehouse laydown yard. Expedite shipment to storage areas on site before April 30, 2018.

Should you have any questions after reviewing this letter, please contact the undersigned at (807) 708-2407.

Regards,

Kenora, ON P9N 1X9
Via email; Matt.hoffmeister@ontario.ca

Dear Mr. Hoffmeister,

RE: AIR QUALITY EXCEEDANCES OF 24-HOUR TOTAL SUSPENDED PARTICULATE-MONITORING LIMITS - SAC REFERENCE #3444-AY8S75

On April 27, the air quality engineer consultant responsible for reporting the site air quality monitoring results, informed New Gold Environment of elevated laboratory results, indicating total suspended particulates (TSP) and iron exceedances at Gallinger Road air quality station. The consultant stated that these values were uncharacteristically high for this particular location and nearby roadwork activities may have contributed to these results.

New Gold notified the Spills Action Centre (SAC) Reference #3444-AY8S75 of the exceedance of the ministry approved limits for Total Suspended Particulate Matter and Iron (metallic) concentrations on April 27th. The exceedance occurred on March 16, 2018 at the Gallinger Air Quality Monitoring Station, and was reported to New Gold on the 27th of April, as per the procedures. The following letter report accompanies a copy of the notification of exceedance (NOE) as per ECA #0412-A2LR4V.

Gallinger Road air quality station is located approximately 4.5 km due east of the primary crusher on the Rainy River Mine Site. Gallinger Road itself passes by the air quality station in a north-south direction at approximately 50 metres east.

TSP samples were collected during a 24-hr period on March 16, 2018 as per Rainy River Project Ambient Air Quality Monitoring Plan, accepted by MOECC on November 9th, 2016. During this 24-hour period, predominate wind direction varied from east to southeast with an average wind speed of 6 km/hr. The wind direction that day, makes it unlikely that the source of the dust would be coming from the crusher which is situated to the west of the air monitoring station, and suggests that the exceedance was related to the road dust.

newgold™ Rainy River

New Gold's dust abatement plan calls for the application of Calcium Chloride to reduce the road dust. However, one of the requirements for the application of this product, or of the application of water, is that it should not be done under frozen conditions. The spring of 2018 has been dry and cold to date with temperatures well below freezing at night and often during the day until the second week of April. On March 16th, temperatures reached 6°C during daylight hours and dropped to -10°C at night. As such the abatement program could not be implemented at that time due to freezing temperatures at night. No precipitation was recorded during the same 24-hour period making road conditions very dry and prone to dust.

New Gold noticed the above average usage of Gallinger road in early April and reminded staff of the mitigation measures which include restricting access of all motor vehicles along Gallinger Road. On April 15th, New Gold posted managers at the corner of Gallinger and Korpi to stop each driver and remind them personally of the road usage restriction. Traffic on Gallinger was reduced from above 75 vehicles between 6 and 7 am to 3 (non-New Gold) in 5 working days. Physical monitoring will remain in place until the end of May. Mitigation measures including watering of Gallinger Road and placing Calcium Chloride on the road surface to reduce road dust will be applied should dust continue to be an issue

Via email; Matt.hoffmeister@ontario.ca

Dear Mr. Hoffmeister,

RE: AIR QUALITY EXCEEDANCES OF 24-HOUR TOTAL SUSPENDED PARTICULATE-MONITORING LIMITS - SAC REFERENCE #3476-AZKQWK

On June 6th, the air quality engineer consultant responsible for reporting the site air quality monitoring results, informed New Gold Environment of elevated laboratory results, indicating total suspended particulates (TSP) and iron exceedances at Gallinger Road air quality station. The consultant stated that these values were higher than normal for this particular location and questioned whether nearby activities contributed to these results.

New Gold notified the Spills Action Centre (SAC) Reference #3476-AZKQWK of the exceedance of the ministry approved limits for Total Suspended Particulate Matter and Iron (metallic) concentrations on June 6th. The exceedance occurred on April 8th, 2018 at the Gallinger Air Quality Monitoring Station, and was reported to New Gold on the 6th of June, as per the procedures. The following letter report accompanies a copy of the notification of exceedance (NOE) as per ECA #0412-A2LR4V.

Gallinger Road air quality station is located approximately 4.5 km due east of the primary crusher on the Rainy River Mine Site. Gallinger Road itself passes by the air quality station in a north-south direction at approximately 50 metres east.

TSP samples were collected during a 24-hr period on April 8th, 2018 as per Rainy River Project Ambient Air Quality Monitoring Plan, accepted by MOECC on November 9th, 2016. During this 24-hour period, predominate wind direction varied from northeast to south-southwest with an average wind speed of 11 km/hr. The wind direction that day, makes it unlikely that the source of the dust would be coming from the crusher which is situated to the west of the air monitoring station, and suggests that the exceedance was related to the road dust.

newgold™ Rainy River

New Gold's dust abatement plan calls for the application of Calcium Chloride to reduce the road dust. However, one of the requirements for the application of this product, or of the application of water, is that it should not be done under frozen conditions. The spring of 2018 has been dry and cold to date with temperatures well below freezing at night. On April 8th, temperatures reached 15.5°C during daylight hours and dropped to -7°C at night. As such the abatement program could not be implemented at that time due to freezing temperatures at night. No precipitation was recorded during the 72-hour period from April 6th to April 8th making road conditions very dry and prone to dust.

As discussed in the air quality exceedance letter report of May 03rd, 2018; New Gold noticed the above average usage of Gallinger road in early April and immediately undertook mitigation measures. Motor vehicle access along Gallinger Road was restricted to local traffic only. On April 15th, New Gold managers, positioned at the corner of Gallinger and Korpi, stopped and reminded each driver of the road usage restriction. Over 5 working days, traffic on Gallinger was reduced from above 15 vehicles between 6 and 7 am to 3 (non-New Gold) vehicles. Physical monitoring continued until the end of May, when all traffic from New Gold had ceased.

New Gold is proceeding with the application of Calcium Chloride along all its roads, including Gallinger. The application should be completed by the end of June.

Once you have had the opportunity to review this document, please contact me at (807) 708-2407 with any questions or concerns.

Dear Mr. Hoffmeister,

RE: 20L Process Water Spill – SAC Reference #2021-B46NNP

On August 31st at approximately 1200, process water was found to be backing up into the Millwright shop from the mill floor. This water was found to have escaped the man door of the Millwright shop and made contact with the ground outside the mill. (See photo below)

The mill was in upset conditions which caused a great deal of process slurry to settle in the works. When the mill was restarted various filter screens, cyclones and sumps were clogged and overtopped onto the mill floor. The process water separated from the slurry and backed up into the Millwright shop then spilled out door 11E. There was no impact to any water body as the process water only migrated about 5 meters outside the door resulting in 20L exiting the mill.
This spill was caught quickly by the operators and work ceased. The gravel containing the process water was placed inside the mill and returned into the process, this was completed by the end of the day shift.

Changes will be made to the mill start up procedure to include monitoring and mitigating the level of process water on the mill floor in the interim. In the longer term, work continues within the mill to ensure proper sloping is in place to direct any process water/slurry to internal sumps.

Once you have had the opportunity to review this information please feel free to contact the undersigned or Sylvie St.Jean (at Sylvie.St.Jean@newgold.com or 807-707-3497) with any additional questions.

Dear Mr. Hoffmeister,

RE: 1000L Tailings Spill – SAC Reference #3763-B4KHDD

On September 13th at approximately 1215 am, tailings was found to be exiting door 3N from the tailings sump pump box and migrated 55 meters to the northeast. See photo below (clean-up was well underway at time of photo)

The spill only lasted a few minutes and quick action by the operators placing sand over the existing berm (speed bump) in front of door 3N stopped 80-90% of the tails from escaping. See photo below.

New Gold Inc., Rainy River Project
5967 Highway 11/71, P.O. Box 5
Emo, ON P0W 1E0

T 807-482-0900
F 807-482-2834
www.newgold.com

Clean-up began right away and finished around 5 pm that day. There was no impact to any water body and all contaminated materials were collected and put back into the mill process.

The cause of this event was a combination of power failures along with process software updates which caused upset conditions in the mill, resulting in failed alarms and pumps operating incorrectly. An internal investigation is on-going.

Once you have had the opportunity to review this information please feel free to contact the undersigned or Sylvie St. Jean (at Sylvie.St.Jean@newgold.com or 807-707-3497) with any additional questions.

Dear Mr. Hoffmeister,

RE: 450L Dyed Diesel Spill Drill 903 – SAC Reference #5120-B7MMFB

At 0300 hours the operator of drill 903 noticed an unexpected drop in fuel level well drilling blast holes in the East Outcrop. (See photo 1 below)

Photo 1: Map of site denoting spill location.

Photo 2: Drill 903

The operator called maintenance for assistance and dismounted to look for a leak. He discovered that he had backed over a large rock and punctured the fuel tank, he then moved the drill off the rock and tilted the drill back to mitigate further spillage (as can be seen in photo 2 above).

At surface, the spill did not appear to be significant but upon further inspection it was noticed that a large amount of fuel had seeped into the shattered rock (see photos 3 and 4 below). Three drill holes were found to be contaminated with dyed diesel.

Photo 3: Spill site

Photo 4: Drill hole

By mid-day a vacuum truck had collected as much fuel as possible from the drill holes and placed it in used oil totes for pick up by Green For Life, a licensed hazardous waste disposal company.

The blasting agent used on site is an emulsion product that contains a significant component of diesel. It is expected that when these holes are loaded and blasted most, if not all, of the residual diesel will be consumed. This will occur by mid-January. At that time the rock will be inspected for contamination.

If the rock is found to be contaminated, it will be sent through the mill as a treatment. If the rock is found to be clean, it will be used onsite to build required infrastructure.

Once you have had the opportunity to review this information please feel free to contact the undersigned or Sylvie St.Jean (at Sylvie.St.Jean@newgold.com or 807-707-3497) with any additional questions.

Dear Mr. Hoffmeister,

RE: 450L Propylene Glycol Spill - SAC Reference #7150-AY33FE

Further to the notification to the Spills Action Centre (SAC) Reference #7150-AY33FE regarding a spill of propylene glycol on April 21st , 2018, the following report is submitted to the Ministry of Environment and Climate Change (MOECC).

Discovery

- Loader operator went to remove a partially emptied tote of propylene glycol while completing cleanup duties at the end of his shift on the TMA North Dam.
- When attempting to pick up the tote, he discovered the loader forks had punctured the plastic tote.
- The operator immediately called his supervisor and stopped all work in the affected area.

Cause

- Puncturing the base of the plastic tote caused the contents to spill onto the ground surface.
- Loader operator performed the task alone without authorization from Supervisor.

Clean Up and Recovery

- Approximately 450 liters of propylene glycol spilled onto the downstream sand seam of TMA North Dam where it was 100% contained. There was no impact to any nearby water sources.

- An estimated 7 m^3 of contaminated sand was scraped up and loaded into a contaminated soil bin.
- Spill pads and boom socks, used during the containment and clean-up process, were collected into barrels.
- Contaminated materials, removed from the immediate area, are stored in a laydown area; awaiting removal from site by a registered hazardous waste carrier.

Preventative Measures

- Implement re-training with team members to understand the importance of a using a spotter when performing all tasks with limited visibility.
- Increase supervisor participation with crews in work areas and reviewing task assignments.

Once you have had the opportunity to review this information, please feel free to contact the undersigned or Sylvie St. Jean at (sylvie.st.jean@newgold.com or 807-707-3497) with any additional questions you may have.

Dear Mr. Hoffmeister,

RE: AIR QUALITY EXCEEDANCES OF 24-HOUR TOTAL SUSPENDED PARTICULATE-MONITORING LIMITS - SAC REFERENCE #3444-AY8S75

On April 27, the air quality engineer consultant responsible for reporting the site air quality monitoring results, informed New Gold Environment of elevated laboratory results, indicating total suspended particulates (TSP) and iron exceedances at Gallinger Road air quality station. The consultant stated that these values were uncharacteristically high for this particular location and nearby roadwork activities may have contributed to these results.

New Gold notified the Spills Action Centre (SAC) Reference #3444-AY8S75 of the exceedance of the ministry approved limits for Total Suspended Particulate Matter and Iron (metallic) concentrations on April 27th. The exceedance occurred on March 16, 2018 at the Gallinger Air Quality Monitoring Station, and was reported to New Gold on the 27th of April, as per the procedures. The following letter report accompanies a copy of the notification of exceedance (NOE) as per ECA #0412-A2LR4V.

Gallinger Road air quality station is located approximately 4.5 km due east of the primary crusher on the Rainy River Mine Site. Gallinger Road itself passes by the air quality station in a north-south direction at approximately 50 metres east.

TSP samples were collected during a 24-hr period on March 16, 2018 as per Rainy River Project Ambient Air Quality Monitoring Plan, accepted by MOECC on November 9th, 2016. During this 24-hour period, predominate wind direction varied from east to southeast with an average wind speed of 6 km/hr. The wind direction that day, makes it unlikely that the source of the dust would be coming from the crusher which is situated to the west of the air monitoring station, and suggests that the exceedance was related to the road dust.

newgold™ Rainy River

New Gold's dust abatement plan calls for the application of Calcium Chloride to reduce the road dust. However, one of the requirements for the application of this product, or of the application of water, is that it should not be done under frozen conditions. The spring of 2018 has been dry and cold to date with temperatures well below freezing at night and often during the day until the second week of April. On March 16th, temperatures reached 6°C during daylight hours and dropped to -10°C at night. As such the abatement program could not be implemented at that time due to freezing temperatures at night. No precipitation was recorded during the same 24-hour period making road conditions very dry and prone to dust.

New Gold noticed the above average usage of Gallinger road in early April and reminded staff of the mitigation measures which include restricting access of all motor vehicles along Gallinger Road. On April 15th, New Gold posted managers at the corner of Gallinger and Korpi to stop each driver and remind them personally of the road usage restriction. Traffic on Gallinger Road was reduced from more than 15 vehicles travelling between 6 and 7 am to zero New Gold employees using the road in 5 working days. Physical monitoring will remain in place until the end of May. Mitigation measures including watering of Gallinger Road and placing Calcium Chloride on the road surface to reduce road dust will be applied should dust continue to be an issue.

Once you have had the opportunity to review this document, please contact me at (807) 708-2407 with any questions or concerns.

RE: 2018 ESA Acoustic Audit – Exceedance of Sound Threshold

Dear Mr. Vandenbroeck,

Consistent with Endangered Species Act (ESA) Permit FF-C-001-14 condition 4.1 and 4.2 New Gold Inc (New Gold) is providing notification to the Ministry of Natural Resources and Forestry (MNRF) that sound threshold was exceeded during the ongoing acoustic audit. However, the source of noise resulting in the exceedance appears unrelated to construction or operations activities and as such no immediate mitigation is proposed.

Preliminary results received from sound recording equipment on May 1st and May 3rd exceeded the 50 dBA sound level threshold;

- At 0300 on May 1, 2018, monitoring equipment recorded sound levels of 61 dBA at the North Receptor Habitat and 60 dBA at the South Receptor Habitat. Recorded sound levels were almost identical indicating a global source, such as a thunderstorm. This exceedance was weather related, not produced by construction activities. Please refer to attached sound files NRM 05.01.2018.3AM and SRM05.01.2018.3AM.

- At 2100 on May 2, 2018, monitoring equipment recorded sound levels of 52 dBA at the North Receptor Habitat. A review of the audio recordings found wildlife activities (birds chirping, frogs croaking) overprinting intermittent equipment noise. Please refer to attached sound file SR62.

These occurrences appear isolated and related to natural phenomena, not construction or operation activities. Therefore, implementation of immediate mitigations measures related to operations or construction activities stipulated in condition 4.1 is not proposed at this time.

Dear Mr. Hoffmeister,

RE: - SAC REFERENCE #0415-AYR2B6

On May 13, a Mill Supervisor informed New Gold Environment of a spill beside the Lime Silo on the northeast side of the mill process building. Initial reports estimated that 1,000 kg of granular High Calcium Quicklime was spread across the ground surface between the mill and silo.

New Gold notified the Spills Action Centre (SAC) Reference #0415-AYR2B6 of the reportable spill as defined in Ontario Regulation 675/98, condition 11(4) of Environmental Compliance Approval No. 5178-9TUPD9 and the internal spill reporting procedure. The estimated amount of the spill exceeded the Federal Transportation of Dangerous Good (TDG) Act Schedule 1 approved limits of 5 kg for Class 8, Corrosive substances. TDG Act classifies Lime as a Class 8 substance.

During the regular unloading process, a contractor supplied delivery hose was connected between the tanker truck and lime silo. Compressed air, used to move the granular lime from the tanker truck to the silo, blew lime out of a rupture in the delivery hose and covered the ground around mill doors 8e and 9e and the Lime silo. West Creek Diversion, the closest fish bearing waterbody located approximately 300 m north of the lime silo, was not impacted. Reclamation trial berms and natural ground contours north of the mill process building provide a natural barrier to any offsite movement of deleterious substances. During this 24-hour period, predominate wind direction was from northeast with an average wind speed of 19 km/hr. Wind direction and speed at the time of the event, confined the spill to a 10 m^2 radius between the lime silo, mill building and tanker truck.

New Gold Inc.
Rainy River Mine
5967 HWY 11/71, P.O. Box 5
Emo, ON P0W 1E0

T 807-482-2501
F 807-482-2834
www.newgold.com

newgold™ Rainy River

Further investigation of the event confirmed that initial reports of the spill quantity were overestimated. In total, only 26 kg of High Calcium Quicklime was lost during the rupture of the delivery hose. Cleanup of the affected area was completed before midnight on May 13, 2018. Granular Quicklime and gravel were collected by a mini Bobcat and placed into the Mill for disposal.

New Gold will be implementing preventative measures to ensure this type of event does not reoccur. These measures include immediate replacement of the delivery hose by the contractor. Going forward, all contractors providing delivery and unloading of Quicklime will be required to provide inspection reports of the delivery hose and delivery system. Reports will be reviewed and signed off by New Gold Mill Supervisor before unloading. Defective hoses will be tagged and removed from the site by the contractor. Additional mitigation measures include the mandatory use of spill trays at the connection points to capture any spillage.

Once you have had the opportunity to review this document, please contact me at (807) 708-2407 with any questions or concerns.

Regards,

Dear Mr. Hoffmeister,

RE: 3000 L Hydraulic Fluid Spill - SAC Reference #2600-AZ2V8F

Further to the notification to the Spills Action Centre (SAC) Reference #2600-AZ2V8F regarding a spill of hydraulic fluid on May 23rd, the following report is submitted to the Ministry of Environment and Climate Change (MOECC) as per condition 11(4) of ECA 5178-9TUPD9.

Discovery

- During routine removal of ore, a PC5500 Komatsu Shovel (unit number 603) lost power to the boom arm.
- The operator then shut the shovel down, noticed the leaking hydraulic fluid and called the Mine Shift Supervisor to inform him of the situation and request a clean-up crew.

Cause

- A rupture in the hydraulic line caused 3,000 litres of hydraulic fluid to flow onto the rocky surface of the open pit.
- The line had failed in the past, but had been patched and a replacement line was on order.

Clean Up and Recovery

- The event occurred within the confines of the open pit with no impact to any water bodies.
- Due to the speed at which the leak occurred, a berm was immediately built to contain and stop the hydraulic fluid from spreading.
- The hydraulic fluid did not penetrate into the ground, as the area is composed of blast rock sitting atop bedrock.
- Green for Life (GFL) arrived on site with a vacuum truck to remove the spilled hydraulic fluid from the pit floor.
- GFL removed approximately 13,500 litres of contaminated hydraulic fluid, water and mud. The vacuum truck transported the contaminated waste back to Thunder Bay for proper disposal.
- All contaminated rock remaining on the pit floor was cleaned, then processed through the primary crusher into the mill.
- Contaminated spill pads, booms and brooms were collected, then placed in appropriate containers and stored at the plant site truck shop for pick up by GFL.

Preventative Measures

- Effective immediately, patched hydraulic hoses will no longer be used under any circumstances.
- The New Gold Mobile Maintenance standard operating procedure (MOP-SOP-0011) will be updated to incorporate this change.

Once you have had the opportunity to review this information, please feel free to contact the undersigned or Sylvie St.Jean (at Sylvie.St.Jean@newgold.com or 807-707-3497) with any additional questions you may have.

Regards,

Via email: Matt.Hoffmeister@ontario.ca

Dear Mr. Hoffmeister,

RE: 300L Process Water Spill - SAC Reference #3476-AZKQWK

Further to the notification to the Spills Action Centre (SAC) Reference #3476-AZKQWK regarding a process water spill on June 9th, the following report is submitted to the Ministry of Environment and Climate Change (MOECC) as per condition 11(4) of ECA 5178-9TUPD9.

Discovery

- During regular operation of the Mill, an employee discovered process water spilling over from the carbon collection tank, flooding the secondary containment area, flowing into the truck ally then exiting out Door 8E.
- Transfer of carbon and excess process water immediately ceased.

Cause

- The carbon safety screen plugged causing the carbon collection tank to fill with a mixture of carbon, slurry and process water.
- A sump pump situated in the collection tank was disconnected and failed to activate.
- Mill doors remain open to provide additional ventilation during summer operations.

Clean Up and Recovery

- The event occurred within the immediate area of the mill process building and Door 8E access with no impact to any water bodies.

- An estimated 300L of process water was lost during the event. Only 76L left the building and spilled outside onto the gravel surface within a 20 meter radius of Door 8E.
- Pooled water near Door 8E was pushed back into the mill. A sandbag berm barrier was constructed to stop flow of water outside of the building.
- Gravel saturated by the spill was dug up and placed inside the mill for processing.

Preventative Measures

- A sump collection project has been approved and will be constructed during June, 2018.
- Sandbag barriers and water collection berms will remain in place until then.

Once you have had the opportunity to review this information, please feel free to contact the undersigned or Sylvie St.Jean (Sylvie.St.Jean@newgold.com or 807-707-3497) with any additional questions you may have.

Regards,

Via email: john.vandenbroeck@ontario.ca

Dear Mr. Vandenbroeck,

RE: 2018 ESA Acoustic Audit – Exceedance of Sound Threshold

As per Endangered Species Act (ESA) Permit FF-C-001-14 conditions 4.1 (g) and 4.2 (b), New Gold is providing notification to the Ministry of Natural Resources and Forestry (MNRF) that sound level thresholds were exceeded during the ongoing acoustic audit. However, the source of noise resulting in the exceedance appears unrelated to construction or operations activities and no immediate mitigation is proposed.

Preliminary results received from sound recording equipment on June 6, 2018 exceeded the 50 dBA sound level threshold:

- Between 11:00 and 13:00 hours on June 6, 2018, monitoring equipment recorded sound levels of 51 and 51 dBA at the North Receptor Habitat also 51 and 52 dBA at the South Receptor Habitat. Recorded sound levels indicate that the exceedances were weather related, likely due to strong winds. Please refer to attached sound files NRM June.06.2018_1120-1130, NRM June.06.2018_1234-1244, SRM June.06.2018_1120-1130, and SRM June.06.2018_1311-1321.

As per ESA Permit conditions 4.1 (g) and 4.2 (b), acoustic audit measurements in the North and South EWPW Receptor Habitat areas were completed on June 7, 2018.

Please contact me with any questions or concerns at (807) 708-2407.

Best Regards,

Dear Mr. Hoffmeister,

RE: TAILINGS SLURRY SPILL 8L - SAC REFERENCE #1728-AZUQ67

On June 15, a contract employee called his area manager at 18:00 hours to inform him of a leak on a fusion coupling on the tailing corridor line at the curve, due north of where the line passes under Roen Road, west of the Marr site. The mill crew had previously completed a visual inspection of the entire tailings line at 17:30 hours and did not report any irregularities. Spray from the leak was covered by a spill tray held in place with a wooden pallet to prevent spreading by evening wind. The mill was shut down and a vacuum truck mobilized onto site to initiate cleanup. New Gold Environment Manager was informed at 20:51 hours and visited the area to assess the spill at 22:00 hours. At that time, it was observed that the Tailings slurry had leaked into the secondary containment area, with some material accumulated on the berm. Clean up continued during the night. A vacuum truck removed slurry from the containment area and disposed of it in Cell 2 of the Tailings Management Area (TMA).

During the morning of June 16th, a New Gold Environmental Technician went out to inspect the cleanup efforts and noticed that approximately 8 L of Tailings Slurry had sprayed over the containment berm onto vegetation. Immediately, the area manager was contacted to organize another cleanup. A vacuum truck returned to site and removed the Tailings Slurry, contaminated vegetation and topsoil in the spill area. Slurry and contaminated vegetation/topsoil mixture were disposed of into Cell 2 of the TMA.

The New Gold internal Environmental Standard Operating Procedure (ENV-SOP-0002) states all Tailings Slurry spills are to be externally reported.

Notification was made to the Ministry of the Environment and Climate Change as well as to the Spills Action Centre (SAC) (Reference #1728-AZUQ67) as defined in Ontario Regulation 675/98, condition 11(4) of Environmental Compliance Approval No. 5178-9TUPD9 and the above cited internal spill reporting procedure.

New Gold has implemented preventative measures to ensure this type of event does not reoccur. These measures include removal of the leaking fusion coupling and replacement with a flanged coupling.

Once you have had the opportunity to review this document, please contact me at (807) 708-2407 with any questions or concerns.

Regards,

Dear Mr. Hoffmeister,

RE: 115L Hydraulic Fluid Spill – SAC Reference #8246-B2PV5U

Further to the notification to the Spills Action Centre (SAC) Reference #8246-2PV5U regarding a spill of hydraulic fluid on July 15, 2018, the following report is submitted to the Ministry of the Environment, Conservation and Parks (MOECP) as per Condition 11(4) of ECA 5178-9TUPD9.

Discovery

- While loading clay into a rock truck, a Komatsu PC650 excavator (unit #653) had a hydraulic line failure (Photo 1).
- The operator shut down the equipment when the line had failed, deployed a spill kit kept in the excavator, and notified the Contractor supervisor and Contractor HSE advisor.

Cause

- A suspected defective hose caused the failure of the hydraulic line resulting in 115 litres of hydraulic fluid spilling to the ground at a clay borrow pit within the footprint of the Tailings Management Area (TMA) (Map 1).

Clean Up and Recovery

- The event occurred within the confines of a clay borrow pit in the TMA footprint, with no impact to any water bodies.
- The hydraulic fluid did not penetrate into the ground, as the spill occurred in a clay borrow pit.
- A spill kit kept in the equipment was deployed by the operator.
- The affected clay was scraped up by bulldozer (Photo 2), loaded into a rock truck and transported to a contaminated soil bin for pick up and proper disposal by the Contractor's hazardous waste management company, Asselin Transportation. The used spill kit materials were deposited in a hazardous waste bin for pick up and proper disposal by Asselin Transportation.

Preventative Measures

- A daily machine inspection was completed and no leaks were observed at the start of shift. Daily inspections and regular maintenance are required by New Gold for all mobile equipment.

Please feel free to contact the undersigned or Sylvie St. Jean (Sylvie.St.Jean@newgold.com or 807-707-3497) with any questions.

Kind Regards,

Dear Mr. Hoffmeister,

RE: PROCESS WATER SPILL 57L - SAC REFERENCE #2504-B3TQR2

During the early morning hours on August 20, while checking a pump and hose line into the secondary containment area around the thickener and leach tanks, a mill employee discovered the line laying on the ground and process water flowing into the truck alleyway in front of Door 18W (Photo 1). Mill Door 18W is located on the west side of the process building, adjacent to the thickener and leach tank secondary containment area.

Photo 1. Extent of process water spill into truck alleyway of Door 18W.

New Gold Inc.
Rainy River Mine
5967 HWY 11/71, P.O. Box 5
Emo, ON P0W 1E0

T 807-482-2501
F 807-482-2834
www.newgold.com

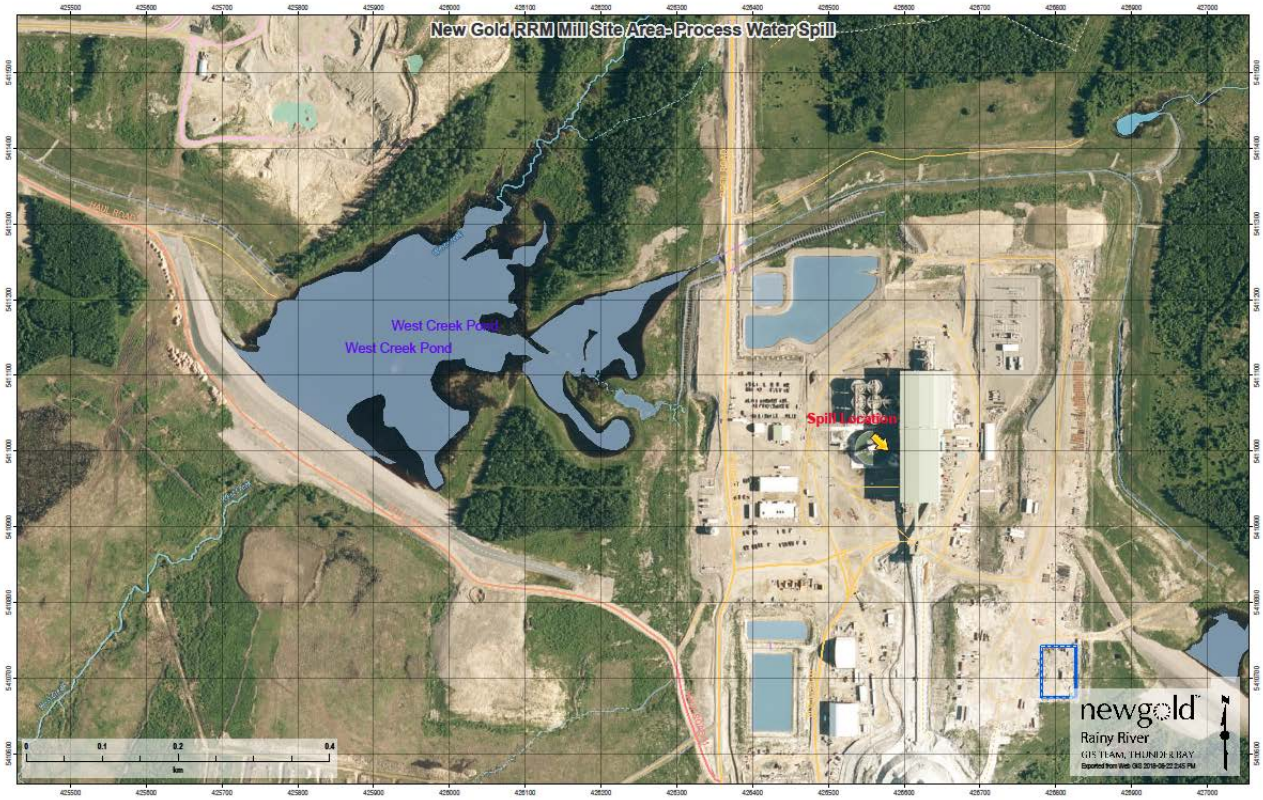

Photo 2. New Gold Rainy River Mine Process Plant site. Spill location denoted in red.

The pump was immediately shut off. Approximately 57L of process water ponded within 25 meters of the door, where it was 100% contained. Mill Door 18W is located 300 to 400 m west of the West Creek Pond and Diversion waterway (Photo 2). Natural topography and man-made features prevented the spill from reaching any further than the alleyway.

At that time of the event, it was observed that the green hose line connected to the pump and positioned over the wall into the containment area was too short. When the pump surged, the force knocked the line back over the wall and onto the ground surface. The green hose line was replaced with a longer black hose line which reached onto the containment area floor (Photo 3).

Photo 3. Black replacement hose on floor of containment area. Green hose line along containment wall.

Spill clean-up of the alleyway took place in the afternoon. Ponded process water and mud was scraped up and deposited into the thickener secondary containment area, where it washed into a floor sump back through the plant. Clean up was completed by 18:00 hours on August 20th (Photo 4).

The New Gold Internal Environmental Standard Operating Procedure (ENV-SOP-0002) states all Process water spills exceeding 25L are to be externally reported.

Notification was made to the Ministry of the Environment, Conservation and Parks as well as to the Spills Action Centre (SAC) (Reference #2504-B3TQR2) as defined in Ontario Regulation 675/98, condition 11(4) of Environmental Compliance Approval No. 5178-9TUPD9 and the above cited internal spill reporting procedure.

Photo 4. Alleyway of Door 18W showing the area after cleaned up was completed.

Dear Mr. Hoffmeister,

RE: VULTREX GEAR LUBRICANT 100L SPILL - SAC REFERENCE #3400-B4PU2N

During the night of September 15, a short and intense storm deposited 29.8 mm of precipitation over the plant site area within a 5-hour period. Precipitation from this storm temporarily overwhelmed the capacity of the east plant site drainage system, located along the toe of the upper bench due east of the mill process building. Run-off water migrated into a laydown area between the mill storage tent and propane tank, which was used to store hydrocarbon totes and barrels. The force of water flowing through the drainage system partially eroded the base under a secondary containment tub which supported a 1000L tote of Vultrex gear lubricant (Photo 1). The tote slid off the secondary containment tub and tipped over, dislodging the bung allowing 100L of gear lubricant to escape onto ground surface (Photo 2).

Photo 1. Tote of Vultrex Gear Lubricant supported on secondary containment tub.

New Gold Inc.
Rainy River Mine
5967 HWY 11/71, P.O. Box 5
Emo, ON P0W 1E0

T 807-482-2501
F 807-482-2834
www.newgold.com

Photo 2. Extent of the gear oil spill into laydown area east of Mill Process building.

The spill occurred approximately 100 m east of mill process building in a laydown area which borders the plant site east drainage ditch system. Runoff water collects in the ditch and is channeled south through the site into the South Pond (Photo 3). All runoff water from the spill area was contained by this internal drainage system the South Pond. Water from the South Pond is used by the mill for processing ore. Any overflow is routed to the Mine Rock Pond via a 20-inch pipeline. New Gold will monitor the South Pond for evidence of hydrocarbon sheen.

Photo 3. GIS image of spill area (pink) and location of contact water drainage ditch (blue hatch).

Photo 4. View of area after cleaned up was completed.

Once all totes and barrels were removed from the area, a skid steer loader was utilized to remove all the hydrocarbon contaminated clays, gravels and vegetation. Contaminated materials were loaded into a 20 yd^3 contaminated soil bin for disposal at the Richardson Landfill. Clean up efforts commenced on Monday, September 16 and were completed by Thursday, September 20, 2018 (Photo 4).

Corrective actions include establishing a new hydrocarbon laydown area on the plant site upper east bench. The laydown will contain a clay and gravel lined secondary containment area used for storage of totes and barrels containing hydrocarbons. All totes/barrels stored outside the secondary containment area will be placed on yellow secondary containment tubs. Construction is scheduled to commence during the week of October 01 – 04, 2018.

Notification was made to the Ministry of the Environment, Conservation and Parks as well as to the Spills Action Centre (SAC) (Reference #3400-B4PU2N) as defined in Ontario Regulation 675/98, condition 11(4) of Environmental Compliance Approval No. 5178-9TUPD9 and in the New Gold Internal Environmental Standard Operating Procedure (ENV-SOP-0002).

Once you have had the opportunity to review this document, please contact me at (807) 708-2407 with any questions or concerns.

Dear Mr. Hoffmeister,

RE: TREATED TAILINGS 30L SPILL - SAC REFERENCE # 5504-BFXLNJ

Further to the notification to the Spills Action Center (SAC) Reference # 5504-BFXLNJ, on November 27, 2018 at 16:33, a tailings line corridor inspection at Emergency Dump Pond #6 noted a tailings line leak at a previously patched line of pipe. The mill was contacted, and shutdown began to take place at 16:36. The treated tailings started to spray onto the access road as the mill commenced shutdown.

Figure 1 shows tailings leak location at 16:50. Tailings spilled onto access road to Emergency Dump Pond 6. Tailings also pooling inside containment due to ice build under WMP reclaim line.

Once the tailings line was depressurized, the previous sleeve patch was inspected, adjusted, and retightened to stop the leak. More spigots were opened to reduce pressure on the tailings line and frequency of inspections increased through out the evening, to ensure the sleeve patch held.

New Gold Inc.
Rainy River Mine
5967 HWY 11/71, P.O. Box 5
Emo, ON P0W 1E0

T 807-482-2501
F 807-482-2834
www.newgold.com

Figure 2 shows where the tailings sprayed out of the sleeve patch (lighter grey area along pipe) and ice build-up within the tailings corridor containment as a result of the spill.

Clean up began the morning of November 28, 2018 once the treated tailings froze. This allowed for the equipment to scrape up the spill without fear of the tailings flowing away from the impacted area. 1m^3 of frozen tailings and contaminated material was removed from the location.

Figure 3 Shows removal of tailings and contaminated material as well as recapped road once clean-up was complete.

The new tailings pipe section is planned to be installed during a maintenance shutdown for the mill. This portion of pipe will be put together in the maintenance shop and fused during the shutdown. In the interim, a portion of belt will be used to cover the sleeve patch and monitored during dayshift and nightshift. The drain to Emergency Dump Pond #6 will also be maintained free of ice to allow drainage in case of emergency.

Figure 4 shows Allmond heater and insulated tarp being used to thaw the frozen tailings from the bottom of the containment as well as thaw ice dam underneath WMP Reclaim line.

Once you have had the opportunity to review this information please feel free to contact the undersigned or Sylvie St. Jean (at Sylvie.St.Jean@newgold.com or 807-707-3497) with any additional questions.

Dear Mr. Hoffmeister,

RE: Tailings Dusting Event – SAC Reference #2502-B6RUM5

On November 22, 2018 a fugitive dust event was reported coming off of the Cell 1 pond in the Tailings Management Area at approximately 14:00 (See photo 1).

Photo 1: Tailings dust from Cell # 1

Winds were gusting up to 35 km/h out of the south and it was evident at the time that the plume was travelling outside of the Environmentally Sensitive Area (ESA) boundary. Samples of snow were taken from Cell 1 north dam and from the northern most tip of the ESA boundary to assess the level of impact. (See Photo 2).

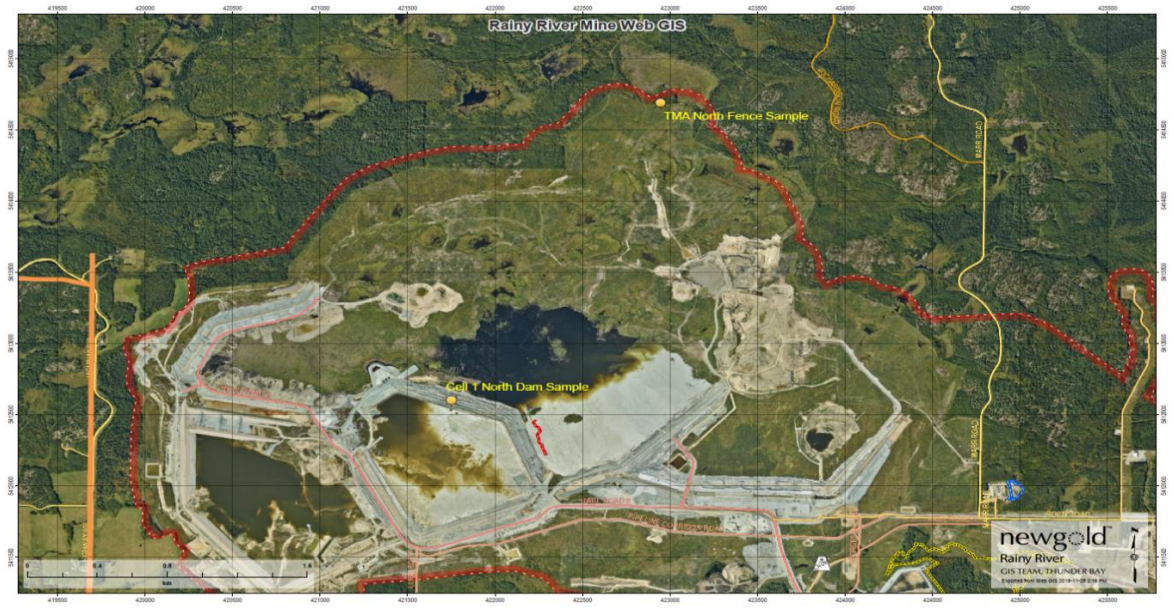

Photo 2: Map showing ESA Boundary

The samples taken were analyzed by ALS Environmental Laboratories in Thunder Bay, indicate there was little to no impact at that time. Tests show the three most prevalent elements on Cell 1 dam to be calcium, iron and sulfur at 38,200 mg/L, 10,600 mg/L and 17,300 mg/L, respectively. Tests results from the TMA North Fences samples showed levels of these elements to be lower by a factor of one thousand times or more (See appendix A).

The following day the weather conditions improved, and no fugitive dust event was seen at that time. However, from November 24th onwards moderate to high winds have persisted from the northwest and the dusting event is continuing at varying intensities. On Sunday November 26th, New Gold updated the Spills Action Center with this information.

New Gold began taking steps to control the fugitive dust on November 23rd which included adding water to Cell 1 in an effort to cover the exposed tailings and installing sprinklers along the banks of Cell 1 to form an ice sheet to keep the dust down. Several other options are currently being investigated in order to find a more permanent solution to the fugitive dust issue.
One option is to cover the exposed tailings with a product known as soil cement to provide a final cap. The soil cement requires constant reapplication, as rain will dilute it and the winter application contains glycerin which would be difficult to treat.
A second option is to apply a mix of hay, overburden and PAG/waste rocks to the exposed tailings. This solution is the most favorable, as it would promote vegetation growth and stabilize the material until subsequent lift will overprint it. Overburden cover should commence when the tailings are frozen enough to support a 40t truck (wiggle wagon).

If you have any further questions, please contact the undersigned.

Respectfully submitted,

Dear Sir,

VIBRATION COMPLAINT – SAC# 3165-B4XRMG

On September 25, 2018 at 1:07 pm New Gold Rainy River Project (RRP) Community Relations received a complaint regarding vibrations felt from a blast on the New Gold Rainy River Project site on Wednesday, September 25 at 11:00 am. As per ECA #0412-A2LR4V terms and conditions section 7.1 and 7.2 please accept this letter as notification;

a) Message from Lisa Teeple stated that the blast caused the floor in the shop, situated 300 ft west of the house, to lift and crack. House and shop are located approximately 2.3 km south-southwest from the blast source. See attached map for reference.

b) A blast was detonated at approximately 11:00 am, September 25, 2018 in the New Gold RRM East Mine Rock Stockpile drainage ditch area, located approximately 3.2 km southeast of the RRM open pit center.

c) Climatic conditions at the time were wind direction 309 degrees (northwest), wind speed 11 km/hr., average relative humidity 83%, average temperature 7.3 degrees C., with cloudy and overcast skies.

d) Ginger Bragg, Supervisor for New Gold RRM Community Relations, received the complaint shortly after the blast.

e) New Gold RRM community personnel communicated to the neighbors and Chapple township that blasting would take place in this area for a period of 8 weeks, from September to October of 2018. Vibration and concussion (air overpressure) readings monitored at 6 locations did not exceed Ministry Publication NPC-119 cautionary values of 10 mm/s and 120 dB respectively.

Vibration and Overpressure Monitoring Stations for Sep 25, 2018			
Station No.	**Station Location**	**Vibration Levels (mm/s)**	**Concussion Levels (dB)**
1	24 Marr	0.317	101.1
2	4298 Hwy 71	0.104	100.4
3	1340 Hwy 600	0.243	95.18

Offset Plan for Fisheries Act Section 35(2)(b) Authorization, Rainy River Mine
Emo, Ontario

Wood Environment & Infrastructure Solutions, a Division of Wood Canada Limited (Wood) was retained by New Gold Inc. (New Gold) to complete the year-two annual performance monitoring of the *Fisheries Act* Authorization (the Authorization) No. 15-HCAA-00039 Offset Plan at the Rainy River Mine in Emo, Ontario. Teeple Pond and outlet channel are the offset measures constructed as per the Offset Plan. The purpose of this 2018 annual monitoring report is to summarize the second year of performance monitoring for the Teeple Pond and outlet channel as per condition 3.1 where it relates to measures and standards in condition 3, and condition 5.2.2 of the Authorization. Recommendations to improve future annual performance monitoring programs are outlined in the enclosed report.

Sincerely,
Wood Environment & Infrastructure
a Division of Wood Canada Limited

Executive Summary

The construction and development of New Gold Inc's (New Gold) Rainy River Mine (RRM) resulted in the unavoidable, but planned, serious harm to a commercial, recreational, or aboriginal fishery, or to fish that support such a fishery. This serious harm to fish required an Authorization from Fisheries and Oceans Canada (DFO) as per Section 35(2)(b) of the Fisheries Act. In order for DFO to authorize the serious harm to fish, development and implementation of fishery offset measures was necessary to ensure that overall fish production is maintained or enhanced (no reduction of fisheries productivity). In the case of the RRM, the impacted fishery, and therefore target fishery of the offset measures are baitfish (primarily minnow) species that inhabit the small creek systems associated with the site. A detailed No Net Loss Plan for the Section 35 fishery impacts (AMEC 2014) was prepared for the Mine and circulated to stakeholders during the Environmental Assessment process. The final Offset Plan (New Gold 2015) for monitoring the performance and measuring success of the offsetting measures was accepted by DFO, and Fisheries Act Authorization No. 15-HCAA-00039 was issued June 4, 2015. The purpose of this document is to summarize the 2018 monitoring results for the offsetting measures and provide comparison to the success criteria and conditions of the Authorization.

Wood Environment & Infrastructure Solutions, a Division of Wood Canada Limited (Wood) was retained by New Gold to conduct the year-two performance monitoring to evaluate the success of the offsetting measures implemented under the Offset Plan and the Authorization. Implementation and effectiveness of the measures are determined by confirming that Teeple Pond and outlet channel have been constructed as per the approved plans and are functioning as intended using the success criteria in the Offset Plan.

The 2018 performance monitoring results showed the physical construction of offset measures achieved the required success criteria (due December 31, 2016) as follows:

- As-built survey demonstrates the offset measures are constructed as per the approved plans; and
- The area of replacement habitat is greater than the required 8.41 hectares;

Achieving the success criteria related to the physical function/structure stability and fisheries components of the Offset Plan are anticipated in 2019 and by 2021, the final year for the currently proposed monitoring. The 2018 performance monitoring results for these components are ahead of schedule and are on track for this monitoring period as described below:

- The outlet channel allows for fish passage under normal and high flow conditions and the Teeple Pond water levels are consistent with those specified in the design;
- Constructed habitat remains stable and in place. Shorelines and graded offset features are stable, and riparian vegetation cover and plantings have achieved good coverage and are greater than the success criteria of 80%;
- Eight fish species were present in the offset measures during the year-two monitoring period; however, two new species were encountered, and one previously documented species was not found. An inferred species richness of nine has been achieved in Teeple Pond, but not in the outlet channel. The fish community survey results show this metric is on track;
- Multiple year classes of several species, and many young-of-the year fish were encountered in the offset measures demonstrating full fish life cycle usage; and,

- Overall catch-per-unit-effort for all species combined was highest for seine netting; and meeting all gear-specific success criteria targets are on target to be met before 2021.

Biological systems such as Teeple Pond outlet channel are dynamic and will likely require several years to develop biological communities that meet the success criteria; however, the year-two monitoring results show very good progress toward these targets.

1.0 Introduction

The construction and development of New Gold Inc's (New Gold) Rainy River Mine (RRM) resulted in the unavoidable, but planned, serious harm to a commercial, recreational, or aboriginal fishery, or to fish that support such a fishery. This serious harm to fish required an Authorization from Fisheries and Oceans Canada (DFO) as per Section 35(2)(b) of the Fisheries Act. In order for DFO to authorize the serious harm to fish, development and implementation of fishery offset measures was necessary to ensure that overall fish production is maintained or enhanced (no reduction of fisheries productivity). In the case of the RRM, the impacted fishery, and therefore target fishery of the offset measures are baitfish (primarily minnow) species that inhabit the small creek systems associated with the site. A detailed No Net Loss Plan for the Section 35 fishery impacts (AMEC 2014) was prepared for the RRM and circulated to stakeholders during the Environmental Assessment process. The final Offset Plan (New Gold 2015) for monitoring the performance and measuring success of the offsetting measures was accepted by DFO and Fisheries Act Authorization No. 15-HCAA-00039 was issued June 4, 2015.

Teeple Pond and outlet channel are the offset measures constructed per the Offset Plan. Construction of Teeple Pond was completed in early 2016 and construction of the Teeple Pond outlet channel was completed between the fall of 2015 and early winter 2016. The Teeple Pond and outlet channel As-Constructed report (condition 5.2.1 of the Authorization) was submitted December 2016 (Amec Foster Wheeler 2016a). The Year 1 annual performance monitoring report was submitted in December 2017. The purpose of this 2018 annual monitoring report is to summarize the second year of performance monitoring for the Teeple Pond and outlet channel per condition 3.1 where it relates to measures and standards in condition 3, and condition 5.2.2 of the Authorization.

2.0 Monitoring Criteria to Avoid or Mitigate Serious Harm to Fish

Condition 3.1 of the Authorization states:

> *Monitoring of avoidance and mitigation measures: The Proponent shall monitor the implementation of avoidance and mitigation measures referred to in condition 2 of this authorization and report to DFO, by March 31 following the year being reported on and indicated whether the measures and standards to avoid and mitigate serious harm to fish were conducted according to the conditions of this authorization.*

The As-Constructed report for Teeple Pond and outlet channel (as per condition 5.2.1 of the Authorization) issued December 19, 2016 (Amec Foster Wheeler 2016a) describes many of the measures and standards required per condition 3.1 of the Authorization. A summary of the As-Constructed report contents is provided in Section 4.0 of this document.

Monitoring criteria that relate to measures or standards to avoid or mitigate serious harm to fish not described in the Teeple Pond and outlet channel As-Constructed report are as follows:

- "Ramp up and down" flow takings in Pinewood River at intake and monitor and adjust water takings to avoid stranding of fish (condition 2.2.3 of the Authorization);
- Implement plan to monitor fish community in Pinewood River between the existing West Creek and Loslo Creek to confirm that the fish community and fish passage are maintained (condition 2.2.4 of the Authorization); and

- Screen or use other deterrents at any water intakes or outlet pipes to prevent entrainment or impingement of fish (condition 2.2.5 of the Authorization).

Further to the above, PTTW #8776-9W2QN2 Condition 4.1.3 issued on August 31, 2015, required that a biological monitoring plan be prepared for the Pinewood River:

> *The Permit Holder shall submit a Biological Monitoring plan to the Director for approval within 180 days of issuance of this permit and prior to direct water taking from the Pinewood River. The plan shall include, at minimum, the following:*
>
> a) Methods for monitoring and identifying fish kills and fish stranding that are acceptable to the Director.
>
> b) A contingency plan to address adverse conditions defined in Condition 4.1.3 a), including investigation into the adequacy of minimum flow thresholds to minimize impacts to aquatic communities.

The 2018 monitoring results and associated monitoring plans for the RRM related to the above measures or standards to avoid or mitigate serious harm to fish are described below:

- New Gold followed flow ramping protocols established to avoid stranding of fish during water taking from the Pinewood River as follows:
  - Immediately after the water taking pumps were energized, the recorded water level at the permanent hydrometric station was monitored to evaluate the rate of reduction;
  - A number of accessible locations downstream of the intake with broad floodplain-type riparian areas (susceptible to forming isolated pool conditions) were inspected for evidence of fish standing or death; and
  - Periodic monitoring of these locations continued until the pumps were ramped up to a steady level and the Pinewood River water level had adducted to the reduced flow, as determined by the hydrometric station instruments, during the water taking activities.
- The pump house intake structure includes fine-mesh screen around the intake channel to deter and prevent entrainment or impingement of fish as discussed in the hydraulics analysis technical memorandum (Amec Foster Wheeler 2015); and
- Monitoring of the Pinewood River fish community between the existing West Creek and Loslo Creek to confirm that the fish community and fish passage are maintained is addressed under the Pinewood River Biological Monitoring Plan per Environmental Compliance Approval (ECA) #5781-9VJQ2J, condition 10(5) and ECA #5178-6TUPD9, condition 8(7) (Amec Foster Wheeler 2016b). The 2018 results from the above biological monitoring plan will be submitted to the Ministry of Environment, Conservation and Parks (MECP) and DFO by March 31, 2019 per condition 3.1 of this Authorization.

3.0 Monitoring Criteria to Assess Offsetting Measures

Condition 5.2 of the Authorization was modified to align the RRM offsetting measures construction and commissioning schedule with the DFO Fisheries Protection Program monitoring (DFO 2016), which states;

List of reports to be provided to DFO: The Proponent shall report to DFO on whether the offsetting measures were conducted according to the conditions of this authorization by providing the following

5.2.1 As-constructed report due on or before March 31, 2016.

5.2.2 Annual monitoring report due on or before December 31 for 5 year post construction (2017-2021).

Implementation and effectiveness of the offset measures is determined by confirming that Teeple Pond and its outlet channel have been constructed as per the approved plans and are functioning as intended using the prescribed monitoring criteria presented below.

Criteria and Dates to Assess Offsetting Measures Implementation and Effectiveness Success

Attribute	Success Criteria	Date
Physical construction of offset measures	• As-built survey demonstrates that measures are constructed as per the approved plans • Area of replacement habitat is equal to or greater than 8.41 ha	December 31, 2016
Physical function of offset measures	• Water levels are consistent with those specified in the design • The outlet channel and pond allows for passage of fish	December 31, 2019
Stability of structures	• Constructed habitat features remain in place (log and boulder structures in place) • Shorelines and graded offset features are stable and not eroding (greater than 80% of features are considered stable) • Riparian vegetation cover and plantings achieve 80% coverage of area, and or survival of planted stock	December 31, 2019
Species presence	• Minimum of 9 species of fish are present in the offset measure.	December 31, 2021
Full life cycle usage	• Multiple year classes including young of the year fish are present in the offset feature.	December 31, 2021

Fish abundance	• Overall Catch per Unit Effort (CPUE) for all species combined, for at least two of following capture methods (electrofishing, Minnow Traps, Seine Nets). Minimum success criteria are:
	  • Minnow Trap CPUE ≥ 2 fish per trap hour
	  • Seine Net CPUE ≥ to 16 fish per 15 m net pull
	  • Electrofishing CPUE ≥ 44 fish per 1000 seconds
		December 31, 2021

Source: Table 5, New Gold 2015; includes revision of success criteria due dates per DFO 2016.

The 2018 monitoring results to assess offsetting measures are presented in the following sections as described below:

- Physical construction of offset measures;
- Physical function of offset measures;
- Stability of structures; and
- Fish community metrics including species presence, abundance, and full life cycle usage.

4.0 Physical Construction of Offset Measures

An As-Constructed report for Teeple Pond and outlet channel (as per condition 5.2.1 of the Authorization) was issued December 19, 2016 (Amec Foster Wheeler). The As-Constructed report provides the following:

- A summary of upset conditions and contingency response associated with the DFO Authorization;
- Comparisons between design parameters and as-constructed conditions of Teeple Pond;
- Comparisons between design parameters and as-constructed depths of Teeple Pond;
- A summary of deviations from design and recommended monitoring for Teeple Pond outlet channel; and
- Comparisons between design areas and as-constructed habitat area of Teeple Pond and outlet channel.

Comparison of the constructed habitat to the approved plan confirmed that 9.86 hectares (ha) area of replacement habitat was constructed, which is greater than the proposed minimum area of 8.41 ha of offsetting measures. The As-Constructed report demonstrated that the offset structures (pond and outlet channel) specified in DFO in Authorization 15-HCAA-00039 and the associated Offset Plan were met, in that minor deviations noted were not expected to impact the overall success of the plan.

5.0 Physical Function of Offset Measures

5.1 Physical Function of Teeple Pond

Teeple Pond was built to include permanent deeper water refuge pools, log and boulder structures, and highly productive emergent wetland margins with a normal water level of 378.50 metres above sea level (masl). The overwintering and summer refuge habitat were constructed to provide between 2.0 and 2.5 m of total water depth at static pond water level design elevation. Monitoring the physical function of Teeple Pond included:

- Installation of a Solinst 3001 LT Levelogger Edge, M10 water level logger with a direct read cable on June 10, 2017 (Figure 1, Appendix A);
- Installation of a Reconyx PC800 Hyperfire Professional Semi-Covert Camera with security enclosure to document Teeple Pond and outlet channel conditions using time lapse photo series (Figure 1, Appendix B); and
- Manual water depth measurements of the overwintering and summer refuge habitat during the summer (Table 1).

In 2017, the Teeple Pond water level logger pressure sensor malfunctioned shortly after installation and the recorded data were unusable. As noted in the 2017 Annual Monitoring Report, Clark Creek Pond is connected via the Clark Creek Diversion Channel that flows approximately 1.2 kilometers (km) with an elevation difference of approximately 1.25 m to its outlet into Teeple Pond, and as such provided a suitable proxy to represent the Teeple Pond water level during the 2017 period of record.

Wood field staff re-installed the Teeple Pond water level logger pressure sensor on April 24, 2018 near the beginning of spring freshet while only the nearshore margins of Teeple Pond were open water (>90% ice cover). The 2018 level logger data show Teeple Pond is functioning as intended (Figure 2), and survey data show the pond is maintaining adequate water depths per the design and providing overwinter refuge habitat for the resident fish community.

The time-lapse camera was programmed to store one image at 06:00, 09:00, 12:00, 15:00, 18:00 and 21:00 each day throughout the year, and was positioned at the edge of tree line near the pond outlet into the constructed outlet channel and fan area. Appendix B contains a photo record for the 2017 and 2018 monitoring seasons, illustrating weekly water level and vegetation growth conditions in the Teeple Pond and outlet fan (June to September 2017 and April to July 2018). The photo record primarily includes photos taken at 15:00 and 18:00, as these times appeared to be most consistent with regard to brightness, clarity and ability to distinguish changes in site conditions with minimal influence from shadows and light intensity. This time lapse photo record confirms static water levels were maintained within Teeple Pond throughout the observation period.

As specified in the Offset Plan, water depth measurements of the pond area are to be conducted once per year during the monitoring period to confirm refuge areas are maintained. The Offset Plan As-Constructed report for Teeple Pond (Amec Foster Wheeler 2016a) confirmed refuge areas were established per the design and in-field water depth checks during the 2018 summer field studies confirmed these areas maintained appropriate water depths within the refuge pool and connecting channels (Tables 1a and 1b; Appendix C). Handheld GPS location accuracy is approximately ±3.0 metres (m); therefore, comparisons of some 2018 field depth measurements to design depths varied. In general, the 2018 station measurements were shallower than the stations visited in 2017. Consequently, the measurement results suggest the deep areas were not visited in 2018. Water levels between 2017 and 2018 were not appreciably different, meaning Teeple Pond maintained sufficient water levels; however, subsequent annual performance monitoring (years three to five post-construction) will revisit the 2017 measurement locations to ensure depths are confirmed at consistent deep-water habitat locations.

Teeple Pond performance monitoring results show pond water levels were maintained per design throughout the 2018 monitoring period as documented by the water level logger data, manually surveyed water levels, time lapse photo documentation and manually measured water depths throughout the pond.

5.2 Physical Function of Teeple Outlet Channel

The Offset Plan physical function performance monitoring criteria require that water depth and velocity measurements in the outlet channel are collected in pools, flats and riffles during at least one low flow period and one high flow period each year (for 3yrs). Teeple Pond outlet channel high flow conditions measurements were conducted by Wood biological field staff April 24 to 27, 2018 and represented the spring freshet condition.

The observed conditions during April 2018 (Table 2b) show sufficient water depth existed during spring freshet to maintain fish passage between Teeple Pond and the outlet channel. The measured velocities with the outlet channel ranged from 0.001 to 0.871 metres per second (m/s) which is within the sustained swimming speeds for the resident species relative to body size and swim distance (Gervais & Katopodis 2013). The photo record provided in Appendix A.2 (Plate A.2-1) illustrates water level conditions throughout the channel during April 2018.

The low flow monitoring event on July 27, 2018 was also conducted by Wood biological field staff. Wetted widths, total depths and water velocity (Table 2a) in pools, flats and riffles were measured (where possible) throughout the pre-determined channel stability stations shown on Figure 1. Due to intermittent flow conditions, flat and pool morphology stations maintained sufficient water depth to provide fish habitat; while riffle areas were dry. This represents a temporary barrier to fish passage which is natural to the system during periods of intermittency, and 2018 represented drier than average conditions. Figure 3 shows a comparison between the 2017 and 2018 Barwick, Ontario monthly precipitation records to the 1981 to 2010 Canadian climate normal for this area, demonstrating the 2018 period of record was drier than 2017 and both years were drier than the normal values. Fish were found in all sampled pools, demonstrating the fish are passing through the channel during periods of higher flow. Similar isolated pool conditions were observed further downstream in the remnant Teeple Drain channel as discussed in Section 6.2. The in-field channel stability station measurements are presented in Tables 2a and 2b, with photo examples of these observations provided in Appendix A (Plate A.2-2 to A.2-5).

General monitoring events throughout the year were conducted by Wood ESC site staff and aquatic studies field staff. The ESC staff documented some areas of erosion in the low flow channel and inlet fan immediately downstream of the Teeple Pond outlet in 2017 (Amec Foster Wheeler 2017a). Observations from June 1, 2018 showed vegetation establishment had progressed, including areas along the low flow channel which was repaired in the summer/fall of 2017.

Beaver activity within Teeple Pond temporarily impacted function of the outlet by reducing flow into the outlet channel. The pond outlet was periodically monitored, and beaver debris was removed to maintain connectivity. Initially the beaver activity is being managed to ensure the channel and habitats stabilize and naturalize according to plan, but over time it is expected that beaver activity will be allowed to persist as it does in any natural system. Representative photos of the blocked outlet and removed debris are provided in Appendix A.

5.3 Physical Function Monitoring Recommendations

The following action items and recommendations from 2017 were implemented and followed during the 2018 period to improve physical function monitoring of Teeple Pond and outlet channel:

- Reinstallation of the Teeple Pond water level logger occurred after ice-off conditions (April 24th, 2018) to ensure open water conditions are monitored per the Offset Plan criteria. Reinstallation of the logger during winter was not recommended as it is likely that the level data recorded during the winter under ice conditions will not be reliable (New Gold 2016)

- The water level logger data were downloaded more frequently following installation of the new sensor and no equipment/instrument failures were detected;

- The 2017 hydraulic habitat monitoring transects/stations (wetted width, total depth and velocity) were utilized where possible for consistency among monitoring events to assess conditions in the outlet under high and low flow conditions.

The following recommendations are provided to improve physical function monitoring of Teeple Pond:

- Download the water level logger and barometric pressure sensors at Teeple Pond once every 30 days during the open water period (April to November);

- Survey the water level relative to the temporary benchmarks at least three times during the open water period (e.g., April, July, September) for comparison to the logger data; and

- Utilize consistent locations for annually monitoring water depths within Teeple Pond for comparison to design depths among monitoring years (utilize 2017 monitoring locations for future measurements).

6.0 Stability of Structures

The stability of structures monitoring took place from July 24 to 29, 2018, which included retrieval of time lapse camera photos in order to monitor long-term water level conditions, as well as opportunistic observations throughout the year to document vegetation cover and plantings, repair activities and general condition. Observations of the offset measures stability were also conducted during the low flow monitoring period, as this timing provided the best visibility to assess whether the constructed features were in place and functional. Photo vantage points were established along the perimeter of Teeple Pond and along the outlet channel to document stability of these features at consistent locations (Figure 1). Three channel stability stations were also established within the constructed outlet channel to further assess and document channel condition. Two additional channel stability stations were established downstream of Teeple Road in natural channel reaches to document channel condition further afield.

6.1 Teeple Pond

Photo stations P1, P2 and P3 were established to document the nearshore areas and open-water habitat of Teeple Pond (Figure 1). Appendix B (Plates B.1-1 to B.1-2) provides a photo record of these stations and the constructed habitat features.

The shoreline, as well as the observed constructed habitat features (tree piles and boulder clusters) appeared (where visible) to remain in place as identified in the As-Constructed report i.e., stable. The boulder clusters and most tree piles were submerged, with the exception of two tree piles positioned near the southwest corner of the pond. The exposed tree piles are meant to provide fish habitat subsurface, as well as perching areas for avian wildlife and basking structures suitable for turtles and other herptiles. Shorelines and graded offset features were stable and not eroding. Riparian vegetation was well established at most areas surrounding Teeple Pond, with the lowest percent ground coverage observed near the outlet fan area discussed in Section 5.2. Overall, these areas have greater than 80% coverage, which meets the success criteria (80% coverage) and will continue to improve over time.

6.2 Teeple Pond Outlet Channel

Photo stations P5, P6 and P7 and channel stability stations CSS-1, CSS-2 and CSS-3 were established to document stability of the outlet channel and immediately downstream of the constructed channel (Figure 1). Photo stations P8 to P11, as well as channel stability station CSS-4 and CSS-5 were established to document channel conditions further downstream of the constructed outlet channel in the original Teeple Channel. Appendix B (Plates B.1-3 to B.1-9) contain a photo record of these stations and constructed habitat features. Overall these areas have greater than 80% riparian vegetation coverage, with plantings showing good survival which meets the success criteria (80% vegetative coverage).

Photo station P7 was positioned immediately downstream of the constructed outlet channel and remnant Teeple Drain channel confluence. During the dry summer conditions little to no flow was observed from either the constructed outlet or remnant channel.

As noted in section 5.2, the shallow conditions under very low flow are considered typical during periods of intermittency, and 2018 represented drier than average conditions (Figure 2). Photo station P8 was positioned immediately upstream of the Teeple Road culvert crossing and includes two bedrock controls within the natural channel alignment. These features had no flow over the rocks at the time of assessment, thereby posing a barrier to fish passage. Again, isolated pools are expected during intermittent flows such as those observed during the summer of 2018. No evidence of erosion was observed between the constructed outlet channel confluence with the original Teeple Drain and photo station P8.

The original Teeple Drain, downstream of Teeple Road, is in an actively used cattle pasture. Consequently, the cattle have destabilized the channel near station P9 and P10 causing severe bank erosion and degradation. The flow path transitions to a broad wet meadow downgradient of this location. Station P10 was located in the wet meadow with surface drainage through the grasses, and no defined central channel. These wet meadow conditions exist further downstream until a channelized flow path enters a woodlot at station P11. No observable channel erosion or instability from the realigned channel flows were noted.

6.3 Contingency Measures for Structure Stability

The Offset Plan (Section 8.4; New Gold 2015) and condition 3.1.2 of the Authorization requires that New Gold will implement contingency measures and associated monitoring if the offsetting measures are not constructed or do not function according to the success criteria.

The following structural stability metrics were identified as not yet meeting their specified success criteria:

- Riparian vegetation throughout the constructed outlet channel was well established, but with small areas of sparse cover in the constructed Teeple outlet fan area. However, substantive improvements in vegetation cover and establishment can be seen between July of 2017 and July of 2018 (Plate B.1-4); and

- The Teeple Pond outlet and sections of the channel experienced bank erosion and some displacement of riffle cobble after spring freshet flow.

In the case of both metrics described above, the observed conditions are in-line with the expected ongoing development of the realigned channel. No additional contingency measures are recommended at this time.

7.0 Fish Community Metrics

Fish community sampling was conducted during July 2018, meeting or exceeding the minimum gear-specific effort specified in Table 7 of the Offset Plan performance monitoring criteria for pond and channel habitats (New Gold 2015). These sampling activities documented species presence, relative abundance and confirmed presence of multiple fish life stages for some species. Fish community results are discussed below for each offset measure habitat type. The comparison of year-one and year-two monitoring results to the success criteria are presented in Tables 3a and 3b, with detailed gear-specific results discussed below and presented in Tables 4 and 5.

7.1 Teeple Pond Fish Community Monitoring Results

Teeple Pond was sampled using the prescribed non-lethal fish collection methods including; minnow traps, seine net and a backpack electrofishing, with gear-specific and catch-per-unit effort (CPUE) results presented in Table 4. Eight fish species were documented in Teeple Pond during the 2018 studies, compared to seven species in 2017. The presence of two new species (Brassy Minnow and Creek Chub) were detected

in 2018, but Common Shiner were not found (previously caught in 2017). These results suggest that nine fish species exist within Teeple Pond, and the low abundance of Common Shiner in 2017 (n=11) may mean they are still present but were not caught during the 2018 field studies. Many young-of-the-year (YOY) individuals were encountered, which were likely members of the Phoxinus genus but were too small to non-lethally confirm species. Most fish were captured by the fine mesh seine net, the majority of which were YOY individuals. Consequently, the high proportion of YOY individuals within Teeple Pond influenced the CPUE of the gear-specific catch results since those smaller individuals were only catchable using seine netting.

A subsample of individuals from each species and from each gear type were measured for fork or total length for those species with rounded caudal fins (e.g., Brook Stickleback and Central Mudminnow). Species-specific results of these measurements, where a minimum of 100 individuals were measured, are presented in Figure 4 illustrating multiple age classes of Brook Stickleback, Fathead Minnow, Northern Redbelly Dace and Brassy Minnow were found in the pond. The abundant presence of YOY Phoxinus sp. indicates a high likelihood that multiple age classes of Finescale Dace are also present. These results confirm that Teeple Pond functions as overwintering and summer refuge, spawning, rearing and foraging habitat for these species.

The 2018 year-two performance monitoring results do not meet all success criteria targets (See Table 4) but show the physical habitat supports all life history stages for the fish species present; and, indicates that the offsetting measures are progressing as expected for achieving all success criteria by year-five of the monitoring program.

7.2 Teeple Pond Outlet Channel Fish Community Monitoring Results

All available habitat within the Teeple outlet channel was sampled using baited minnow traps and backpack electrofishing methods, with most effort concentrated in pools and flats where sufficient depth allowed sampling. Low water levels during this sampling event concentrated fish into these refuges, but also reduced the overall sampling area. The relatively small sample area required that both fish collection gear types were used throughout the entire outlet channel to satisfy the minimum sampling efforts per the Offset Plan. Gear-specific and catch-per-unit effort (CPUE) results for the outlet channel are presented in Table 5 along with the success criteria CPUE values expected by year-five of monitoring.

Minnow trapping was conducted first, and the captured individuals were released into Teeple Pond to avoid re-capture of those individuals using electrofishing. Electrofishing was conducted after minnow trapping and captured far fewer fish. This was expected due to the removal of fish by minnow trapping thereby understating the actual electrofishing CPUE. The electrofished individuals were also released into Teeple Pond, since low water conditions were likely to persist through August and further limit available habitat within the outlet channel (as observed in the natural Teeple Drain channel).

A total of six fish species were encountered in Teeple outlet channel during the 2018 studies, compared to seven in 2017. Two fish species encountered in 2017 that were not captured in 2018 were Northern Redbelly Dace and Pearl Dace. Additionally, Brassy Minnow were encountered in the outlet channel and was not previously encountered in 2017. The changes in species occurrence could be attributed to extremely dry conditions which resulted in isolated pools offering the only refuge for fish trapped within the outlet channel.

8.0 Performance Summary

Implementation and effectiveness of the compensation measures are determined by confirming that the pond and outlet channel have been constructed as per the approved plans and are functioning as intended using the success criteria and dates in Table 5 of the Offset Plan (New Gold 2015). Biological systems such as Teeple Pond and the outlet channel are dynamic and will likely require several years to develop full biological communities that meet the success criteria; however, the year-one and year-two monitoring results show very good progress toward these targets.

The physical construction of offset measures, as well as the physical function and stability of structures post monitoring success criteria have been achieved for Teeple Pond and outlet channel. Presence of multiple year classes of fish have been demonstrated within these offset measures and the inferred richness of nine fish species within Teeple Pond, thereby achieving those success criteria. The remaining species presence (richness) within the outlet channel and abundance (overall CPUE) success criteria are not yet achieved.

Further to the above, the fish catch results show thousands of YOY cyprinid individuals (seine netting catch), which will likely substantively improve the species-specific CPUE for each gear type in future studies as these individuals grow and mature into larger, spawning individuals within the population. It is anticipated that the majority of these fish will survive overwinter in refuge pools, and as such will help the population sooner attain the carrying capacity and productivity of this habitat. The performance monitoring results comparison to success criteria for Teeple Pond and outlet channel are summarized in Tables 6a and 6b, respectively.

9.0 Closing

We trust the information provided in this report meets the performance monitoring obligations with respect to Offset Plan. Should you require further details or wish to discuss any aspect of this information, please do not hesitate to contact us at your convenience.

Sincerely,
Wood Environment & Infrastructure Solutions

Species Richness [4]	**7**	**9**

Notes:

1. List of expected species from the Fish Habitat No Net Loss Plan Section 35(2) Waterbodies, Table 3-3 (AMEC 2015)
2. Fathead Minnow were not previously listed to occur within the sub-watershed but were encountered during the year-one and year-two performance monitoring studies.
3. Common Shiner were not caught during the 2018 studies; however, the low abundance in 2017 (n=11) suggested they are likely still present and can be considered "present" for the purposes of this monitoring.
4. The 2018 species richness includes the inferred presence of Common Shiner, therefore, the inferred species richness satisfies the success target identified in the Offset Plan.

Notes:

1. CPUE = catch-per-unit-effort, expressed as the number of fish caught per gear-specific effort type
2. Minnow trap effort presented as the number of fish caught per minnow trap hour; Offset Plan minimum effort required for monitoring (1,500 hours)
3. Seine net effort presented as the number of fish caught per 15 metre net haul; Offset Plan minimum effort required for monitoring (10 individual 15 m net hauls)
4. Backpack electrofishing effort presented as the number of fish caught per 1,000 electrofishing seconds; Offset Plan minimum effort required for monitoring (10,000 seconds)
5. All gear-specific minimum required efforts were met or exceeded

Table 5. Teeple Pond Outlet Channel Fish Community Monitoring Results Summary

Gear	Sample ID	Sample Date (DD/MM/YY)	No. of Gear	Total Effort	Species Specific Catch and CPUE												
					Brassy Minnow	Brook Stickleback	Central Mudminnow	Common Shiner	Creek Chub	Fathead Minnow	Finescale Dace	Northern Redbelly Dace	Pearl Dace	YOY Cyprinid	Catch Total (n)	Catch CPUE	Ultimate (5-year) Target CPUE
Minnow Trap	TCD-MT1	13/07/17	13	374.8	0	109	4	0	0	1	0	4	3	0			>2

Notes:

1. CPUE = catch-per-unit-effort, expressed as the number of fish caught per gear-specific effort type.
2. Minnow trap effort presented as the number of fish caught per minnow trap hour; Offset Plan minimum effort required for monitoring (250 hours).
3. Backpack electrofishing effort presented as the number of fish caught per 1,000 electrofishing seconds; Offset Plan minimum effort required for monitoring (1,000 seconds).
4. All gear-specific minimum required efforts were exceeded.

Table 6a. Comparison of Performance Monitoring Results to Success Criteria for Teeple Pond

Attribute and Due Date	Success Criteria	Year-one	Year-two	Ultimate (5-year) Post Monitoring Success Criteria
Physical Construction of Offset measures (December 31, 2016)	As-built survey demonstrates that measures are constructed as per the approved plans	Yes	Yes	**Achieved**
	Area of replacement habitat is equal to or greater than 8.41 ha	Yes	Yes	**Achieved**
Physical Function of Offset Measures (December 31, 2019)	Water levels are consistent with those specified in the design	Yes	Yes	**Achieved**
	The outlet channel and pond allows for passage of fish	Yes	Yes	**Achieved**
Stability of Structures (December 31, 2019)	Constructed habitat features remain in place (log and boulder structures in place)	Yes	Yes	**Achieved**
	Shorelines and graded offset features are stable and not eroding (greater than 80% of features are considered stable)	>80%	>80%	**Achieved**
	Riparian vegetation cover and plantings achieve 80% coverage of area, and or survival of planted stock	Approx.70%	>80%	**Achieved**
Species Presence (December 31, 2021)	Minimum of 9 species of fish are present in the offset measure.	7	9*	**Achieved**
Full Life Cycle Usage (December 31, 2021)	Multiple year classes including young of the year fish are present in the offset feature.	Yes	Yes	**Achieved**
Fish Abundance (December 31, 2021)	Overall Catch per Unit Effort (CPUE) for all species combined, for at least two of following capture methods (electrofishing, Minnow Traps, Seine Nets). Minimum success criteria are:			
	Minnow Trap CPUE ≥ 2 fish per trap hour	0.5	1.8	On track
	Seine Net CPUE ≥ to 16 fish per 15 m net pull	216	98	**Achieved**
	Electrofishing CPUE ≥ 44 fish per 1,000 seconds	5.8	5.4	On track

Notes:

1. CPUE = catch-per-unit-effort, expressed as the number of fish caught per gear-specific effort type
2. Achieved = planned success criteria already achieved
3. On track = within the expected progress for the performance monitoring period
4. High proportion of YOY individuals within Teeple Pond influenced CPUE of gear-specific results since those fish were only catchable using seine netting
5. (*) Species richness includes inferred presence of Common Shiner previously encountered in low abundance during the 2017 studies.

Table 6b. Comparison of Performance Monitoring Results to Success Criteria for Teeple Outlet Channel

Attribute and Due Date	Success Criteria	Year-one	Year-two	Ultimate (5-year) Post Monitoring Success Criteria
Physical Construction of Offset measures (December 31, 2016)	As-built survey demonstrates that measures are constructed as per the approved plans	Yes	Yes	**Achieved**
	Area of replacement habitat is equal to or greater than 8.41 ha	Yes	Yes	**Achieved**
Physical Function of Offset Measures (December 31, 2019)	Water levels are consistent with those specified in the design	Yes	Yes	**Achieved**
	The outlet channel and pond allows for passage of fish	Yes	Yes	**Achieved**
Stability of Structures (December 31, 2019)	Constructed habitat features remain in place (log and boulder structures in place)	Yes	Yes	**Achieved**
	Shorelines and graded offset features are stable and not eroding (greater than 80% of features are considered stable)	>80%	>80%	**Achieved**
	Riparian vegetation cover and plantings achieve 80% coverage of area, and or survival of planted stock	Approx.70%	>80%	**Achieved**
Species Presence (December 31, 2021)	Minimum of 9 species of fish are present in the offset measure.	7	6	On track
Full Life Cycle Usage (December 31, 2021)	Multiple year classes including young of the year fish are present in the offset feature.	Yes	Yes	**Achieved**
Fish Abundance (December 31, 2021)	Overall Catch per Unit Effort (CPUE) for all species combined, for at least two of following capture methods (electrofishing, Minnow Traps, Seine Nets). Minimum success criteria are:			
	Minnow Trap CPUE ≥ 2 fish per trap hour	0.32	0.05	On track
	Electrofishing CPUE ≥ 44 fish per 1,000 seconds	41.5	25.9*	On track

Notes:

1. CPUE = catch-per-unit-effort, expressed as the number of fish caught per gear-specific effort type
2. (*) Electrofishing CPUE artificially reduced due to removal of fish during minnow trapping effort conducted prior to electrofishing.
3. Achieved = planned success criteria already achieved
4. On track = within the expected progress for the performance monitoring period

Dear Ms. St-Jean:

Re: 2018 Annual Monitoring Report
Schedule 2 MDMER Fish Habitat Compensation Plan, Rainy River Mine
Emo, Ontario

Wood Environment & Infrastructure Solutions, a Division of Wood Canada Limited (Wood) was retained by New Gold Inc. (New Gold) to complete the year-one annual performance monitoring of the Schedule 2 Metal and Diamond Mining Effluent Regulations Fish Habitat Compensation Plan at the Rainy River Mine in Emo, Ontario. The compensation waterbodies included Clark Creek, Stockpile and West Creek ponds and diversion channels. The purpose of this 2018 annual monitoring report is to summarize the first year of performance monitoring for the compensation measures and to provide recommendations to improve future annual performance monitoring programs.

Sincerely,
Wood Environment & Infrastructure
a Division of Wood Canada Limited

Executive Summary

The New Gold Inc. (New Gold) Rainy River Mine is situated in the Township of Chapple, approximately 65 kilometres northwest of Fort Frances in Northwestern Ontario. This report provides findings of the year-one post-construction performance monitoring as per commitments made in the regulatory amendment to Schedule 2 of the Metal and Diamond Mining Effluent Regulations listing and associated Fish Habitat Compensation Plan (FHCP). The FHCP requires monitoring for the construction and post construction phases of development and the two primary commitments include:

1. As-Constructed report which was submitted December 2017; and

2. Annual performance monitoring studies to confirm the physical function, structural stability and fish community ecological success metrics.

Wood Environment & Infrastructure Solutions, a Division of Wood Canada Limited was retained by New Gold to conduct the year-one performance monitoring to evaluate the success of the compensation measures implemented under the FHCP. Implementation and effectiveness of the measures are determined by confirming that Clark Creek Diversion (includes Clark Creek Pond and Diversion Channel) and West Creek Diversion (includes Stockpile Pond and Diversion Channel, and the West Creek Pond and Diversion Channel) have been constructed as per the approved plans and are functioning as intended using the success criteria in the FHCP.

The 2017 As-Constructed report showed the physical construction of compensation measures achieved the required success criteria. The year-one perfomance monitoring of ecological success criteria related to the physical function, structure stability and fisheries components of the FHCP were generally achieved in 2018 as described below:

- The Clark Creek Pond and West Creek Pond diversion channels allowed for fish passage under normal and high flow conditions and the Clark Creek and West Creek pond water levels are consistent with those specified in the design;
- Constructed habitat remains stable and in place for all Schedule 2 Amendment waterbodies. Shorelines and graded offset features are stable, and riparian vegetation cover and plantings have achieved moderate to good coverage, greater than the 80% success criteria;
- Seven fish species are present in the Clark Creek Diversion, whereas 12 species are present within the West Creek Diversion (success criteria target nine species);
- Multiple year classes of several species, and many young-of-the year fish were encountered in the compensation measures demonstrating full fish life cycle usage; and,
- Overall catch-per-unit-effort for seine netting achieved fish abundance success criteria, with the remaining gear-specific results showing the fish community is on track to meet the success criteria targets before 2021.

The success criteria related to the physical function of Stockpile Pond and the portion of the Stockpile Diversion Channel, between the pond outlet and confluence with West Creek Tributary 2, did not perform as expected. The pond water level decreased during the summer and water was not flowing in the above noted section of the diversion channel. Consequently, approximately 75% of the West Creek Diversion achieved the FHCP performance criteria. However, the function of the Stockpile Pond is still largely effective at providing a permanent habitat for small bodied fish. The observed maximum depth of

Stockpile Pond in 2018 is more than sufficient to provide overwintering refuge areas for all resident fish species and therefore is serving the intended function but connectivity between Stockpile Pond, Stockpile Diversion and West Creek Pond will be monitored.

Biological systems such as Clark Creek, Stockpile and the West Creek ponds and diversion channels are dynamic and will likely require several years to develop biological communities that meet the success criteria; however, the year-one monitoring results show very good progress toward these targets.

1.0 Introduction

The New Gold Inc. (New Gold) Rainy River Mine (RRM) is situated in the Township of Chapple, approximately 65 kilometres (km) northwest of Fort Frances in Northwestern Ontario (Figure1-1). This Fish Habitat Compensation Plan (FHCP) annual monitoring report is provided for compliance with the commitments of the FHCP pursuant to the Schedule 2 Metal and Diamond Mining Effluent Regulations (MDMER) amendments associated with the project. This is the first year of a specified five year monitoring cycle.

Construction and development of the RRM required the deposition of mine waste (overburden, rock and mine water / effluent) in waterbodies that are frequented by fish. This deposition required a regulatory amendment to Schedule 2 of the MDMER. In order for the Government of Canada to complete the regulatory amendment, an approved FHCP was provided to offset losses of fisheries associated with the deposits. Previously, a detailed No Net Loss Plan (NNLP) for the MDMER Schedule 2 Amendment Waterbodies (AMEC 2014a,b) had been prepared for the RRM and circulated to stakeholders during the Environmental Assessment process. A subsequent detailed FHCP was submitted to Department of Fisheries and Oceans Canada (DFO) in May 2015 which was intended to summarize the impacts and compensation measures described in the NNLP and provide additional details of the associated monitoring commitments (Amec Foster Wheeler 2015). Schedule 2 waterbody listings do not have formal DFO authorizations and monitoring conditions associated with them as do Section 35 *Fisheries Act* approvals. Instead, the approved FHCP, as per Section 27 of the MDMER becomes the agreed upon and contractual commitment for the construction and monitoring of the compensation measures.

A revised FHCP to address changes to the site design and Project schedule was submitted in January 2017 (Amec Foster Wheeler 2017a). The Schedule 2 amendment process was completed in fall 2017 (as published in Canada Gazette vol 151(20), October 4, 2017).

The impacted fish community, and corresponding target fishery of the FHCP are baitfish (primarily minnow) species that inhabit the small creek systems associated with the site. The compensation waterbodies include Clark Creek, Stockpile and West Creek ponds and diversion channels. Construction of Clark Creek Pond was completed in early 2016 and construction of the Clark Creek diversion channel was completed by late 2016. The Stockpile Pond and diversion channel were constructed by early 2016, whereas the West Creek Pond and Diversion Channel construction was completed by late 2017. An As-Constructed monitoring report was submitted December 2017 (Amec Foster Wheeler 2017b) as per Section 8.3, Table 5 of the approved FHCP.

The As- Constructed report confirmed that overall the compensation measures were constructed and functioning as per the approved plans. The purpose of this 2018 annual performance monitoring report is to summarize the first year of performance monitoring; which includes biological and habitat stability indicators, for the constructed ponds and diversion channels.

2.0 Schedule 2 Listed Waterbodies and Monitoring Requirements

The RRM works listed to Schedule 2 are as follows:

1. Development of the Tailings Management Area (TMA) which will impound tailings in the upper reaches of Loslo Creek and Marr Creek;

2. Construction of the Water Discharge Pond and Constructed Wetland in the mid and lower reach of Loslo Creek. These ponds will receive treated mine effluent and seepage from the TMA dam; and

3. Construction of the West Mine Rock and Overburden Stockpiles in the lower reach of Marr Creek.

The delineation of mine works and approved Schedule 2 waterbodies associated with the RRM, as well as the performance monitoring locations discussed in the following sections are shown on Figures 2-1 and 2-2.

The FHCP requires monitoring for the construction and post construction phases of development. The two primary commitments include:

3. As-Constructed report which was submitted December 22, 2017 (Amec Foster Wheeler 2017b) and included the following measures:

    a. An As-Constructed survey to confirm the physical construction of compensation measures were as per the approval FHCP design. The survey included areas of wetted and frequently flooded habitats, all constructed habitat features, water depths, vegetation zones, and channels;

    b. Photo documentation record during construction to document that mitigation and avoidance measures were implemented, and that all structures were constructed as per the approved FHCP design; and

    c. A comparison of the constructed habitat to the approved FHCP to confirm that the area of replacement habitat is equal to or greater than 25.7 hectares (ha).

4. This annual performance monitoring report to show ecological success, including;

    a. Physical function of compensation measures;

    b. Structural stability of compensation measures; and

    c. Fish community metrics including species richness, full life cycle usage of created habitat and standardized fish abundance targets.

3.0 Criteria to Assess Performance of the Compensation Measures

Implementation and effectiveness of the compensation measures are determined by confirming that Clark Creek Diversion (includes Clark Creek Pond and Diversion Channel) and West Creek Diversion (includes Stockpile Pond, West Creek Pond and associated diversion channels) have been constructed as per the approved FHCP and are functioning as intended using the prescribed monitoring criteria. The FHCP performance monitoring success criteria and corresponding section within this report are presented in Table 3-1.

Table 3-1: Performance Monitoring Success Criteria for Compensation Measures

Attribute	Report / Section	Success Criteria
Physical construction of compensation measures	Compensation Plan for MMER Schedule 2 Amendment Waterbodies As-Constructed Report; submitted December 22, 2017 Summary provided in Section 4.0.	• As-built survey demonstrated that measures were constructed as per the approved FHCP • Area of replacement habitat was equal to or greater than 25.7 ha
Physical function of compensation measures	Section 5.0	• Water levels are consistent with those specified in the design • The outlet channel and pond allow for passage of fish
Stability of structures	Section 6.0	• Constructed habitat features remain in place (log and boulder structures in place) • Shorelines and graded offset features are stable and not eroding (greater than 80% of features are considered stable) • Riparian vegetation cover and plantings achieve 80% coverage of area, and/or survival of planted stock
Species presence	Section 7.0	• Minimum of 9 species of fish are present in each of the two (2) diversion areas (Clark Creek and West Creek Diversion).
Full life cycle usage		• Multiple year classes including young of the year fish are present in the compensation features.

Fish abundance		• Overall Catch per Unit Effort (CPUE) for all species combined, for at least two of following capture methods (electrofishing, Minnow Traps, Seine Nets). Minimum success criteria are:
		  ◦ Minnow Trap CPUE ≥ 2 fish per trap hour
		  ◦ Seine Net CPUE ≥ 16 fish per 15 m net pull
		  ◦ Electrofishing CPUE ≥ 44 fish per 1,000 seconds

4.0 Physical Construction of Compensation Measures

An As-Constructed report for the Schedule 2 Amendment Waterbody Compensation meaures was issued December 22, 2017 (Amec Foster Wheeler 2017b). The As-Constructed report provided the following:

- A summary of upset conditions and contingency responses;
- Comparisons between design parameters and as-constructed conditions of the compensation measures;
- Comparisons between design parameters and as-constructed depths of the compensation measures;
- A summary of deviations from design and recommended monitoring for the compensation measures; and
- Comparisons between design areas and as-constructed habitat areas of the compensation measures.

Comparison of the constructed habitat to the approved plan confirmed the as-constructed compensation measures generally exceeded the design area committed to in the FHCP as follows:

Compensation Measure	Design Area (ha)	Actual Constructed Area (2017)(ha)	Observerved Areas (2018) (ha)
Clark Creek Pond and Diversion Channel	3.86	3.99	maintained
Stockpile Pond and Diversion Channel	5.64	5.67	1.69
West Creek Pond and Diversion Channel	16.08	16.07	maintained
Combined Areas	**25.6**	**25.7**	**21.7**

A total of 25.7 hectares (ha) of replacement habitat was constructed, which is greater than the proposed minimum area of 21.3 ha of compensation measures. The 2017 As-Constructed report demonstrated that the compensation structures (ponds and diversion channels) specified in the FHCP were met, and that the minor deviations from design were not expected to impact the overall success of the Plan.

The 2018 performance monitoring data show Stockpile Pond did not fill as anticipated, and the static pond water level measured during July 2018 field studies was used to calculate an approximate surface area of 16,902 m^2. This lower surface water elevation at the time of pond water depth measurements means Stockpile Pond was providing approximately 30% of the intended replacement habitat specificed in the approved design for Stockpile Pond. The year-one performance monitoring studies observed that the habitat areas provided more than the minimum area specified in the approved FHCP, and the following sections discuss this difference in existing conditions relative to the physical function, structure stability and fish community performance monitoring success criteria.

5.0 Physical Function of Compensation Measures

The surrounding waterbodies and watercourse near the RRM naturally experience periods of low precipitation and dry conditions that can temporarily limit fish passage and physical function of these habitats. The 2018 precipitation records from the Environment and Climate Change Canada (ECCC) Barwick, Ontario climate station and records from the onsite New Gold meteorological station (Barron Site) data were compared to the 1981 to 2010 Canadian climate normals. The recent data confirms 2018, particularly the Barron Site data during the open water period between April and August, was generally drier than the normal values (Figure 5-1). The 2017 ECCC data are also shown, which suggest a recent trend in higher than average amounts of precipitation are occurring in September with drier than average conditions during the summer months. Consequently, these drier conditions have potential implications to the physical function and performance of the compensation measures as discussed below.

The approved FHCP physical function performance monitoring criteria discussed in the following sections include:

- Water depth measurement, water level monitoring and photo documentation of pond conditions; and
- Water depth and velocity measurements in the diversion channels to be collected in pools, flats and riffles during at least one low flow period and one high flow period each year (for 5 years).

5.1 Physical Function of Clark Creek Diversion

The physical function of Clark Creek Diversion performance monitoring results show Clark Creek Pond water levels were maintained as per the approved design throughout the 2018 monitoring period as documented by the water level logger data, manually surveyed water levels, and manually measured water depths throughout the pond. The physical function of Clark Creek Diverion Channel performance monitoring results show channel water levels were maintained per design throughout the spring high flow period and intermittent flow was observed during the low flow period as expected. As such, the Clark Creek Diversion has achieved the physical function success criteria as specified in the approved FHCP, and discussed in further detail below.

5.1.1 Physical Function of Clark Creek Pond

Clark Creek Pond was built to include permanent deeper water refuge pools, log and boulder structures, and highly productive emergent wetland margins with a normal water level of 378.7 metres above sea level (masl). The overwintering and summer refuge habitat were constructed to provide between 1.5 and 2.75 metres (m) of total water depth at static pond water level design elevation. Performance monitoring the physical function of Clark Creek Pond included:

- Photo documentation of pond water levels and stability monitoring stations discussed in Section 7.0 (Appendix A and B, respectively);
- Installation of a Solinst 3001 LT Levelogger Edge, M10 water level logger adjacent to the dam with a direct read cable on June 10, 2017 (Figure 5-2 and Appendix A); and
- Manual water depth measurements of the overwintering and summer refuge habitat during the summer for comparison to design water depths (Table 5-1).

The Clark Creek Pond water level logger pressure sensor data, as well as the manually surveyed water level data shown on Figure 5-2 confirm the pond maintained water levels throughout 2018, with a maximum seasonal fluctuation of 0.39 m during the open water period (April to November).

As specified in the FHCP, water depth measurements of the pond area were conducted once per year during the monitoring period to confirm refuge areas are maintained. The FHCP As-Constructed report (Amec Foster Wheeler 2017b) confirmed refuge areas were established per the design and in-field water depth measurements during the 2018 summer field studies confirmed that these areas maintained appropriate water depths of 1.5 to 2.8 m within the refuge pool and connecting channels (Table 5-1). The Clark Creek Pond as-constructed drawings, showing the maunual depth measurement locations are provided in Appendix C.

5.1.2 Physical Function of Clark Creek Diversion Channel

Clark Creek Diversion Channel high flow performance monitoring was initiated on April 25, 2018 by Wood field staff. The observed high flow conditions show sufficient water depth existed during spring freshet to maintain fish passage between Clark Creek Pond and the diversion channel (Table 5-2). The total depths of riffles ranged between 0.02 and 0.50 m, with measured velocities ranging from 0.004 to 1.313 metres per second (m/s) which is within the sustained swimming speeds for the resident species relative to body size and the short swim distances through the riffle areas with higher velocity (Gervais & Katopodis 2013, Di Rocco 2018). The photograph record provided in Appendix A.2 illustrates water level conditions within the channel during April and July 2018.

The low flow monitoring event on July 24, 2018 was also conducted by Wood field staff. Diversion channel wetted widths, total depths and water velocity in pools, flats and riffles were measured where possible (Table 5-3) throughout the channel stability stations shown on Figure 2-1. The low gradient of Clark Creek Diversion Channel provided pool and flat habitat throughout most of the channel; however, no measureable flow was observed within the channel due to intermitent flow conditions. Total depths ranged from 0.04 to 0.61 m within all habitat types (Table 5-3). Figure 5-1 shows a comparison between the 2017 and 2018 Barwick, Ontario monthly precipitation records to the 1981 to 2010 Canadian climate normal for this area, demonstrating the 2018 period of record was drier than 2017 and both years were drier than the normal values. Fish were found in all sampled channel habitats, demonstrating the fish are passing through the channel and connectivity is maintained with Teeple Pond downstream even between periods when the outlet of Clark Creek Pond is not actively flowing.

5.2 Physical Function of West Creek Diversion

The West Creek Diversion achieved the physical function success criteria as specified in the approved FHCP for West Creek Pond and Diversion Channel. Stockpile Pond did not function as intended, with the static water level elevation approximately 2.8 m less than the design thereby providing approximately 30% of the replacement habitat specified in the design. The low pond water level meant the section of Stockpile Diversion Channel between the pond outlet and West Creek Tributary 2 did not receive outflow water in 2018. Consequently, Stockpile Pond and Stockpile Diversion Channel did not achieve the physical area success criteria as discussed in further detail below.

5.2.1 Physical Function of Stockpile Pond

Stockpile Pond was built to include permanent deeper water refuge pools, log and boulder structures, and highly productive emergent wetland margins with a normal water level of 372.3 masl. The overwintering

and summer refuge habitat were constructed to provide between 2.0 and 6.3 m of total water depth at static pond water level design elevation. Monitoring the physical function of Stockpile Pond included:

- Photo documentation of pond water levels and stability monitoring stations discussed in Section 7.0 (Appendix A and B, respectively);
- Installation of a Solinst 3001 LT Levelogger Edge, M10 water level logger adjacent to the diversion channel, opposite the dam in dry conditions, with a direct read cable on June 15, 2017 (Figure 5-3 and Appendix A); and
- Manual water depth measurements of the overwintering and summer refuge habitat during the summer for comparison to design water depths (Table 6-4).

The Stockpile Pond water level logger pressure sensor data on Figure 5-3 show the water level increased during spring freshet conditions and the transducer was submerged from approximately March 21 to July 25, 2018. The most recent peak in water level occured on approximately May 25, 2018, afterwhich water levels steadily decreased until the transducer was above the water level on July 25, 2018. The period of record between July 25 and November 28, 2018 indicates water levels were below the transducer and Stockpile Pond was not maintaining a normal water level per the approved design.

As specified in the approved FHCP, water depth measurements of the pond area were conducted on July 29, 2018, even though water levels were below design elevation. The in-field water depth measurements of refuge areas showed water depths of 0.20 to 3.2 m where depths should have ranged from 3.2 to 5.2 m per the design (Table 5-4). The Stockpile Pond as-constructed drawings, showing the manual depth measurement locations are provided in Appendix C.

Despite the reduced aerial extent and maximum depth of the stockpile pond diversion habitat, the function of the measure is still largely effective at providing a permanent habitat for small bodied fish. The observed maximum depth of 3.2 m is more than sufficient to provide overwintering refuge areas for all resident fish species.

5.2.2 Physical Function of Stockpile Diversion Channel

Stockpile Diversion Channel high flow performance monitoring was initiated on April 25, 2018 by Wood field staff. The survey documented that water from Stockpile Pond was not flowing through the channel; however, water from the West Creek Tributary 2 stream provided constant flow during the high flow monitoring event. Consequently, the section of diversion channel between the pond outlet and the confluence with West Creek Tributary 2 did not receive flow during the 2018 season other than surface runoff during periods of precipitation. As discussed above, 2018 was a drier than average year, and additional years monitoring will confirm whether this channel segment is periodically flowing and as such hydraulically connected to the downstream habitats.

High flow monitoring was conducted between the West Creek Tributary 2 inflow and the outlet to West Creek Pond near the Roen Road box culverts. The pool and flat habitats contained total depths of up to 0.57 m with velocities ranging from 0 to 0.422 m/s. The total depths of riffles ranged between 0.04 and 0.14 m, with velocities ranging between 0.179 to 0.833 m/s (Table 5-5). These velocities are within the sustained swimming speeds for the resident species relative to body size and the short swim distances through the riffle areas with higher velocity (Gervais & Katopodis 2013, Di Rocco 2018). The photograph record provided in Appendix A.3 illustrates water level conditions within the channel during April and July 2018.

The low flow monitoring event on July 24, 2018 documented water from Stockpile Pond was not flowing through the channel due to low pond water level elevation and there was no flow contribution from West Creek Tributary 2. Consequently, the diversion channel performance monitoring was conducted within areas of the channel between the Roen Road box culverts crossing and upstream confluence with the West Creek Tributary 2 where possible (Table 5-8) throughout the pre-determined channel stability stations shown on Figure 2-2. Diversion channel reaches with flat and pool morphology maintained sufficient water depth to provide fish habitat; however, the riffle areas were mostly dry (Table 5-6). The dry conditions are natural to the system during periods of intermittency, and 2018 represented drier than average conditions. Fish were found in the isolated pools, thereby demonstrating fish are passing through the channel during periods of flow. This was further substantiated by observations from New Gold and Wood site staff in early May 2018 that confirmed White Sucker (*Catostomus commersonii*) were staging to spawn and congregating at the Roen Road box culverts in the lower reaches of the diversion channel.

5.2.3 Physical Function of West Creek Pond

West Creek Pond was built to include permanent deeper water refuge pools, log and boulder structures, and highly productive emergent wetland margins with a normal water level of 361.0 masl. The overwintering and summer refuge habitat were constructed to provide between 1.5 and 4.0 m of total water depth at static pond water level design elevation. Monitoring the physical function of West Creek Pond included:

- Photo documentation of pond water levels and stability monitoring stations discussed in Section 7.0 (Appendix A and B, respectively);
- Installation of a Solinst 3001 LT Levelogger Edge, M10 water level logger adjacent to the dam, near the outlet spillway, with a direct read cable on April 26, 2018 (Figure 5-2 and Appendix A); and
- Manual water depth measurements of the overwintering and summer refuge habitat during the summer for comparison to design water depths (Table 5-7).

The West Creek Pond water level logger pressure sensor data, as well as the manually surveyed water level data shown on Figure 5-4 confirm the pond maintained water levels throughout 2018, with a maximum seasonal fluctuation of 0.24 m during the open water period (April to November).

As specified in the approved FHCP, water depth measurements of the pond area were conducted once per year during the monitoring period to confirm refuge areas are maintained. The FHCP as-constructed report (Amec Foster Wheeler 2017b) confirmed refuge areas were established per the design and in-field water depth measurements during the 2018 summer field studies confirmed that these areas maintained appropriate water depths of 1.0 to 4.6 m within the refuge pool and connecting channels (Table 5-1). The West Creek Pond as-constructed drawings are provided in Appendix C.

5.2.4 Physical Function of West Creek Diversion Channel

West Creek Diversion Channel high flow performance monitoring was initiated on April 24, 2018 by Wood field staff. The observed high flow conditions show sufficient water depth existed during spring freshet to maintain fish passage between West Creek Pond, the diversion channel and Loslo Creek (Table 5-8). The total depths of riffles ranged between 0.06 and 0.41 m, with velocities ranging between 0.043 to 0.959 m/s (Table 5-8). These measured velocities are within the sustained swimming speeds for the resident species relative to body size and the short swim distances through the riffle areas with higher velocity (Gervais & Katopodis 2013, Di Rocco 2018). The photograph record provided in Appendix A.4 illustrates water level conditions within the channel during April, May and July 2018.

The low flow monitoring event on July 24, 2018 was also conducted by Wood field staff. Diversion channel wetted widths, total depths and water velocity in pools, flats and riffles were measured where possible (Table 5-9) throughout the pre-determined channel stability stations shown on Figure 2-2. No measureable flow was observed within the channel due to intermitent flow conditions. Total depths ranged from 0.02 to 1.2 m within all habitat types, and station CSS-5 near the outlet of West Creek Pond was dry. Figure 5-1 shows a comparison between the 2017 and 2018 Barwick, Ontario monthly precipitation records to the 1981 to 2010 Canadian climate normal for this area, demonstrating the 2018 period of record was drier than 2017 and both years were drier than the normal values.

Fish were found in all sampled channel habitats, further demonstrating the fish are passing through the channel and connectivity is maintained between West Creek Pond and Loslo Creek. This was further substantiated by observations from New Gold and Wood site staff in early May 2018 that confirmed White Sucker were staging to spawn and congregating in the channel reaches between stations CSS-1 and CSS-3 (Appendix A.4; Plate A.4-5).

5.3 Physical Function Monitoring Recommendations

The following recommendations are provided to improve physical function monitoring of the compensation measures:

- Investigate loss of water within Stockpile Pond as this measure will not meet the physical function success criteria until the pond contains normal water levels per the design and pond outflow activates the reach of Stockpile Diversion Channel between the pond outlet and confluence with West Creek Tributary 2.

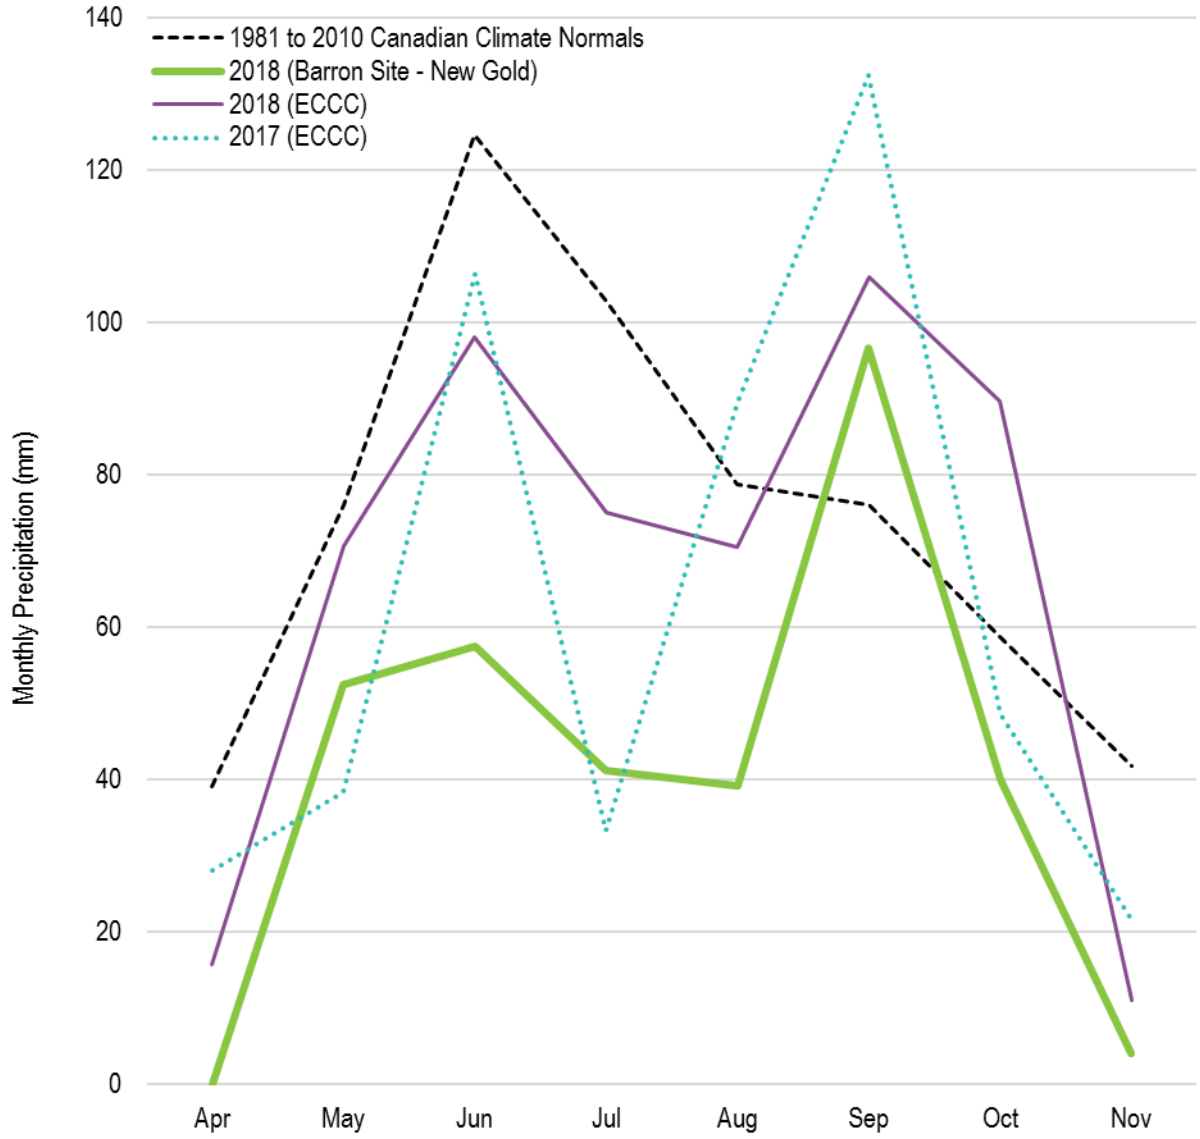

Figure 5-1: Monthly Precipitation Record

Notes:

1. Environment and Climate Change Canada, Barwick Climate Station ID 6020559 monthly precipitation records for 2017, 2018 and the 1981 to 2010 Canadian Climate Normals shown to demonstrate 2017 and 2018 were generally drier than average during the open water period (April to November).
2. Barron Site precipitation data provided by New Gold.

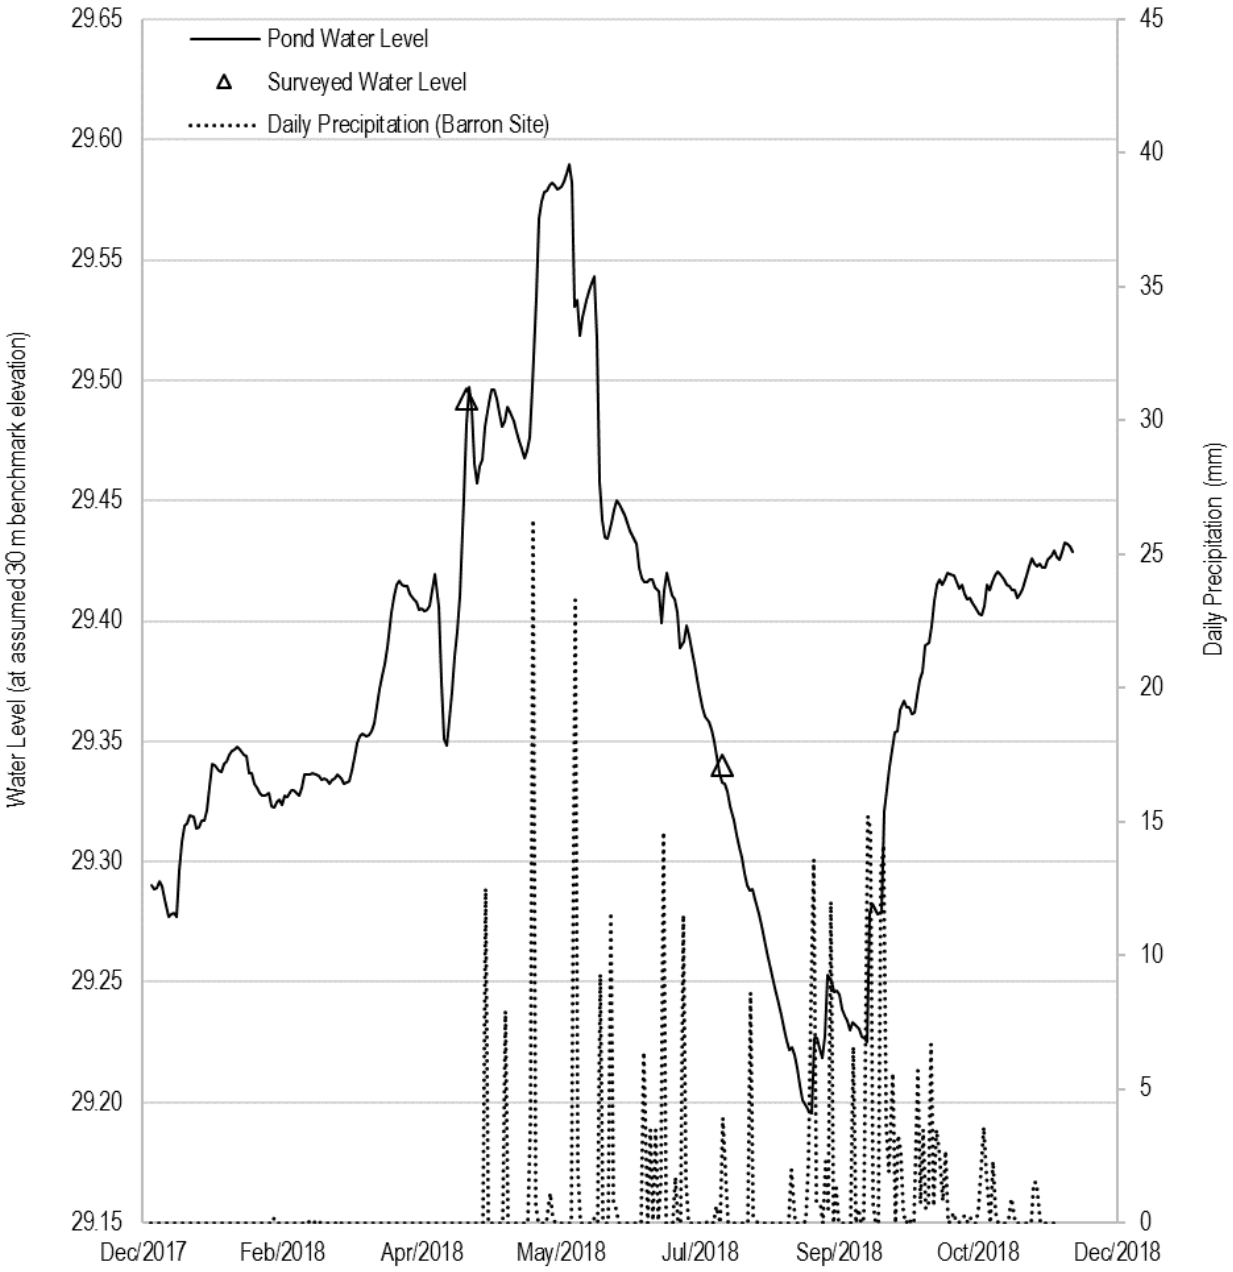

Figure 5-2: Clark Creek Pond Water Level and Survey Data

Notes:

1. Daily precipitation data from Barron Site provided by New Gold.

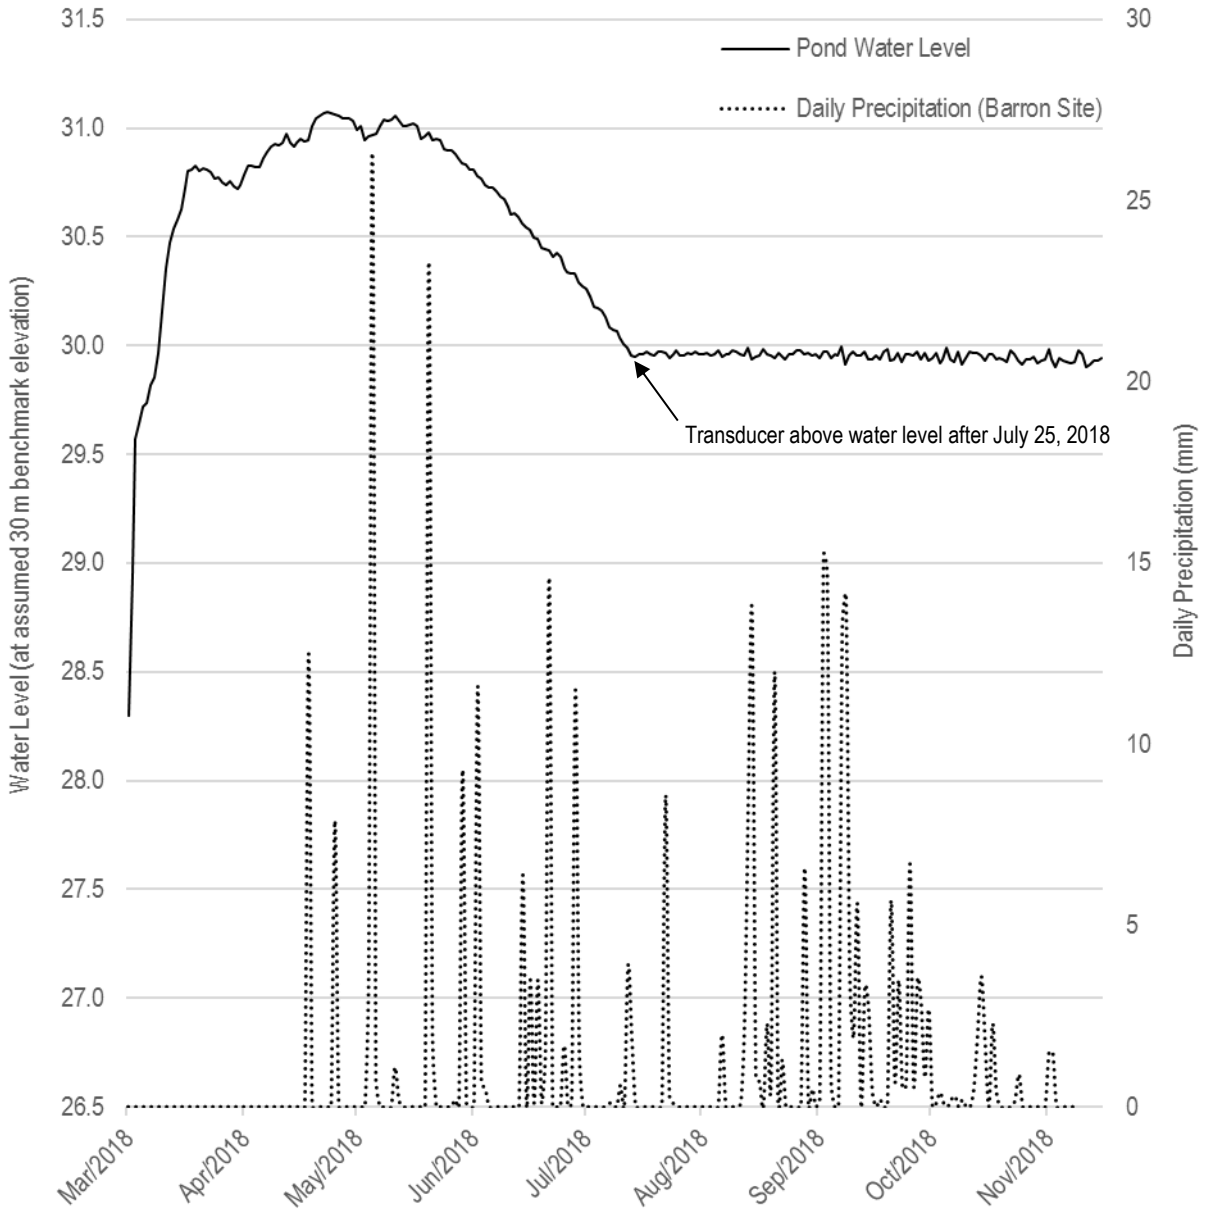

Figure 5-3: Stockpile Pond Water Level Data

Notes:

1. Stockpile Pond water level logger transducer was submerged from approximately March 21 to July 25, 2018.
2. The transducer was above the pond water level after July 25, 2018 as shown by the static level data to the end of this period of record (November 28, 2018).
3. Daily precipitation data from Barron Site provided by New Gold.

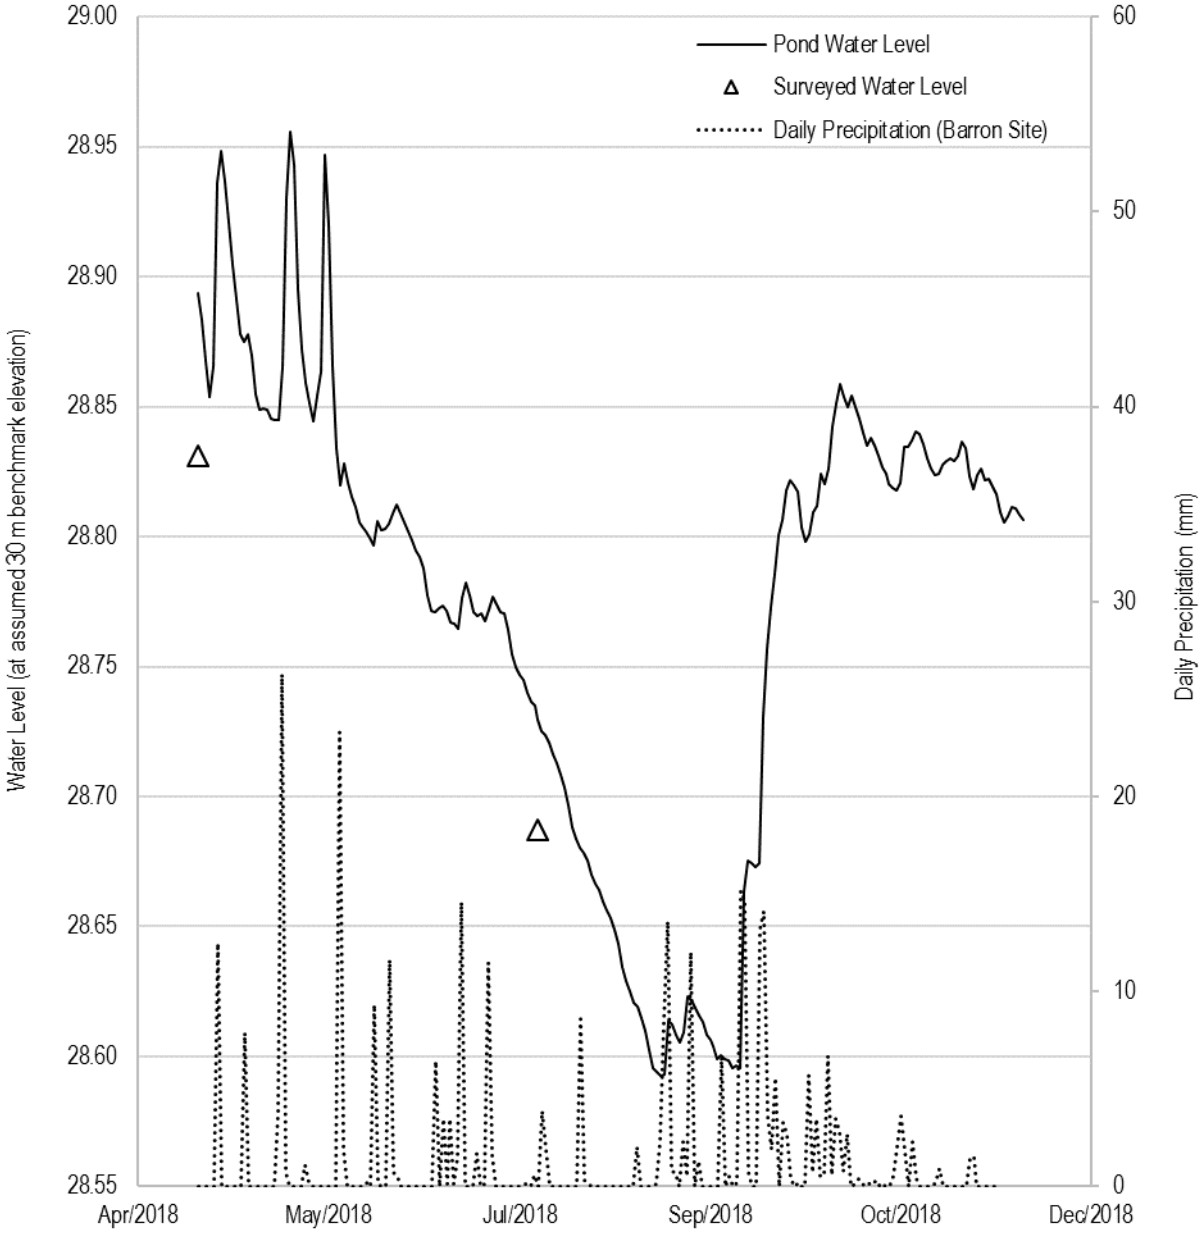

Figure 5-4: West Creek Pond Water Level and Survey Data

Notes:

1. West Creek Pond water level logger installed April 26, 2018.
2. Daily precipitation data from Barron Site provided by New Gold.

6.0 Stability of Structures

Performance monitoring of the sturcture stability included a dedicated site assessment between July 24 and 29, 2018, as well as opportunistic observations throughout the year by on site staff to document vegetation cover and plantings, repair activities and general condition as able. Observations of the compensation measures stability were conducted during the low flow monitoring period as this timing provided the best visibility to assess whether the constructed features were in place and functional. Photo vantage points were established along the perimeter of the ponds and along the diversion channels to document stability of these features at consistent locations (Appendix B).

6.1 Clark Creek Diversion

All of the Clark Creek Diversion constructed habitat features were observed to remain in place and more than 80% of shorelines and graded offset features are considered stable. Riparian vegetation and cover plantings have achieved more than 80% coverage. As such, the compensation measures have achieved the stability of structures success criteria specified in the approved FHCP as discussed in detail below.

6.1.1 Clark Creek Pond

Photo stations P1 and P2 were established to document the nearshore areas and open-water habitat of Clark Creek Pond (Figure 2-1). Appendix B (Plates B.1-1 and B.1-2) provides photographs of these stations and the constructed habitat features during high and low flow monitoring events to show changes in water level and vegetation cover.

The shoreline, as well as the observed constructed habitat features (tree piles and boulder clusters) appeared (where visible) to remain in place as identified in the As-Constructed report. Most boulder clusters and some tree piles were submerged, with one exposed boulder pile near the southern region of the pond and three emergent tree piles positioned near the southern, northern and eastern extents of the pond. The nearshore partly exposed tree piles are meant to provide subsurface fish habitat, as well as perching areas for avian wildlife and basking structures suitable for turtles and other herptiles. All observed shorelines and graded offset features were stable and not eroding, thereby meeting the success criteria of greater than 80% of features are considered stable. Riparian vegetation was well established at most areas surrounding Clark Creek Pond, with no areas of concern identified. Overall, these areas have greater than 90% vegetation cover, which meet the success criteria of greater than 80% coverage identified within the approved FHCP.

6.1.2 Clark Creek Diversion Channel

Photo stations P3, P4 and P5 and channel stability stations CSS-1, CSS-2 and CSS-3 were established to document stability of the Clark Creek Diversion Channel (Figure 2-1). Appendix B (Plates B.1-3 to B.1-5) provides photographs of these stations and the constructed habitat features during high and low flow monitoring events to show changes in water level and vegetation cover.

The shallow conditions observed during the low flow monitoring event are considered typical during periods of intermittency, and 2018 represented drier than average conditions (Figure 6-1). Due to the low gradient design, much of the Clark Creek Diversion Channel contained water in pool and flat morphology, despite drier than average conditions. The rock riffle in CSS-1 was dry at the time of observation on July 24, 2018. This feature had less than 0.01 m water depth at the time of assessment, thereby posing a potential barrier to fish passage during extended periods of low precipitation and limited or no outflow

from Clark Creek Pond. Additionally, beaver activity was observed directly upstream of the rock riffle in CSS-1, which posed a partial fish barrier to fish. Beaver dams are natural components of the creak system and regularly result in partial obstructions to fish movement. No evidence of erosion was observed within the diversion channel, meaning the channel has met the success criteria and that greater than 80% of the channel is considered stable. Riparian vegetation was well established at most areas along the Clark Creek Diversion Channel, with no areas of concern identified. Overall, the diversion channel has greater than 90% vegetation cover, which meet the success criteria of greater than 80% coverage identified within the approved FHCP.

6.2 West Creek Diversion

The West Creek Diversion compensation measures have achieved the stability of structures success criteria specified in the approved FHCP. Even though Stockpile Pond has not filled with water to the design water level, and a section of the Stockpile Diversion Channel does not receive outflow from the pond, the constructed habitat features are in place, more than 80% of shorelines and graded offset features are considered stable and riparian vegetation and cover plantings have more than 80% coverage. Future performance monitoring activites will confirm continued stability of these stuctures. The following sections provide further details regarding the stability of each West Creek Diversion compensation measure.

6.2.1 Stockpile Pond

Photo station P14 was established to document the nearshore areas and open-water habitat of Stockpile Pond (Figure 2-2). Appendix B (Plates B.2-5 and B.2-6) provides photographs of this station and the constructed habitat features during high and low flow monitoring events to show changes in water level and vegetation cover.

The shoreline, as well as the observed constructed habitat features (tree piles and boulder clusters) appeared to remain in place as identified in the As-Constructed report. Many of the boulder clusters and tree piles were exposed, due to low water level elevation within the pond during the July 2018 monitoring event. All observed shorelines and graded offset features were stable and not eroding, thereby meeting the success criteria of greater than 80% of features are considered stable. Riparian vegetation was well established at most areas surrounding Stockpile Pond, with no areas of concern identified. Overall, these areas have greater than 90% vegetation cover, which meet the success criteria of greater than 80% coverage identified within the approved FHCP.

6.2.2 Stockpile Diversion Channel

Photo stations P11, P12 and P13 and channel stability stations CSS-6, CSS-7 and CSS-8 were established to document stability of the diversion channel (Figure 2-2). Appendix B (Plates B.2-1 to B.2-4) provides photographs of these stations and the constructed habitat features during high and low flow monitoring events to show changes in water level and vegetation cover.

The shallow conditions observed during the low flow monitoring event are considered typical during periods of intermittency, and 2018 represented drier than average conditions (Figure 6-1). Due to the lack of outflow from Stockpile Pond or West Creek Tributary 2 inflow, much of the Stockpile Diversion Channel was dry during the low flow monitoring event. Consequently, only isolated pools and flat sections contained water. Some evidence of localized erosion was observed within the diversion channel but overall the channel has met the success criteria and that greater than 80% of the channel is considered

stable. Riparian vegetation was well established at most areas along the Stockpile Diversion Channel, some spares areas noted near the CSS-7 station. Overall, the diversion channel has greater than 80% vegetation cover, which achieves the success criteria identified within the approved FHCP.

6.2.3 West Creek Pond

Photo stations P8, P9 and P10 were established to document the nearshore areas and open-water habitat of West Creek Pond (Figure 2-2). Appendix B (Plates B.3-10 and B.3-12) provides photographs of these stations and the constructed habitat features during high and low flow monitoring events to show changes in water level and vegetation cover.

The shoreline, as well as the observed constructed habitat features (tree piles and boulder clusters) appeared (where visible) to remain in place as identified in the As-Constructed report. Most boulder clusters and some tree piles were submerged. The exposed tree piles are meant to provide subsurface fish habitat, as well as perching areas for avian wildlife and basking structures suitable for turtles and other herptiles. All observed shorelines and graded offset features were stable and not eroding, thereby meeting the success criteria of greater than 80% of features are considered stable. Riparian vegetation was well established at most areas surrounding West Creek Pond, with no areas of concern identified. Overall, these areas have greater than 90% vegetation cover, which meet the success criteria of greater than 80% coverage identified within the approved FHCP.

6.2.4 West Creek Diversion Channel

Photo stations P1 to P7 and channel stability stations CSS-1 to CSS-5 were established to document stability of the West Creek Diversion Channel (Figure 2-2). Appendix B (Plates B.3-1 to B.3-9) provide photographs of these stations and the constructed habitat features during high and low flow monitoring events to show changes in water level and vegetation cover.

The shallow conditions observed during the low flow monitoring event are considered typical during periods of intermittency, and 2018 represented drier than average conditions (Figure 6-1). Due to the lack of outflow from West Creek Pond, the upper reaches of West Creek Diversion Channel were dry during the low flow monitoring event. The mid and lower reaches contained water in all habitat types, but no measurable flow. No evidence of erosion was observed within the diversion channel, meaning the channel has met the success criteria and that greater than 80% of the channel is considered stable. Riparian vegetation was well established at most areas along the West Creek Diversion Channel, with no areas of concern identified. Overall, the diversion channel has greater than 90% vegetation cover, which meet the success criteria of greater than 80% coverage identified within the approved FHCP.

6.3 Structure Stability Monitoring Recommendations

The Clark Creek and West Creek Diversions are meeting or are on track to achieve the performance monitoring success criteria. The year-two performance monitoring studies will assess Stockpile Pond and additional measures may be taken if required to increase water levels.

7.0 Fish Community Metrics

The year-one fish community performance monitoring results show the physical habitat supports all life history stages for the fish species present. These results indicate that the compensation measures are progressing as expected for achieving all success criteria by year-five of the monitoring program.

Fish community sampling was conducted during July 2018, using non-lethal fish collection methods including; minnow traps, seine net and a backpack electrofishing as specified in the approved FHCP. Sampling efforts met or exceeded the minimum gear-specific requirements as specified in Table 7 of the approved FHCP performance monitoring criteria for pond and diversion channel habitats (New Gold 2017). These sampling activities documented species presence, relative abundance and confirmed presence of multiple fish life stages for some species. Fish community results are discussed below for each compensation measure habitat type. The detailed gear-specific results and comparison of year-one Clark Creek, Stockpile and West Creek ponds and diversion channel performance monitoring results to the approved FHCP success criteria are discussed below.

7.1 Clark Creek Diversion

The Clark Creek Diversion fish community results show multiple year classes of several species were present, a total of seven fish species were documented and the seine net fish community abundance success metric was achieved. Other gear-specific catch results show fish abundance is on track to achieving all success criteria by year-five of the monitoring program, as discussed below.

7.1.1 Clark Creek Pond Fish Community Monitoring Results

A summary of the Clark Creek Pond fish species caught during the 2018 field studies is provided in Table 7-1, with gear-specific and catch-per-unit effort (CPUE) results in Table 7-2. Seven fish species were documented in Clark Creek Pond during the 2018 studies. Northern Redbelly Dace and Finescale Dace were the most abundant species, followed by Pearl Dace and Brook Stickleback. Many young-of-the-year (YOY) individuals were encountered, which were likely members of the Phoxinus genus but were too small to non-lethally confirm species (e.g., likely Finescale Dace, Northern Redbelly Dace, or hybrids of these species). Most fish were captured in baited minnow traps or by the fine mesh seine net. The majority of seine net catch were YOY individuals (93% of catch), representing approximately 45% of the cumulative total catch from all gear types in the pond (Table 7-2). Consequently, the high proportion of YOY individuals within Clark Creek Pond influenced the CPUE of the gear-specific catch results since those smaller individuals were only catchable using seine netting.

A subsample of individuals from each species and from each gear type were measured for fork or total length for those species with rounded caudal fins (e.g., Brook Stickleback and Central Mudminnow). Species-specific results of these measurements, where a minimum of 100 individuals were measured, are shown on Figure 7-1 illustrating multiple age classes of Brassy Minnow, Brook Stickleback, Finescale Dace, Northern Redbelly Dace and Pearl Dace were present. These results confirm that Clark Creek Pond functions as overwintering and summer refuge, spawning, rearing and foraging habitat for these species.

7.1.2 Clark Creek Diversion Channel Fish Community Monitoring Results

Pool, flat and riffle habitats were sampled using minnow traps and backpack electrofishing; however, no measurable flow was observed within the channel and no outflow from Clark Creek Pond was noted. Fish within the diversion channel did however have unimpeded access to Teeple Pond. A summary of the Clark

Creek Diversion Channel fish species caught during the 2018 field studies is provided in Table 7-1, with gear-specific and CPUE results in Table 7-2. Three fish species were documented in Clark Creek Diversion Channel during the 2018 studies. Northern Redbelly Dace and unidentified YOY (likely Phoxinus species) represented 92% of the total cumulative catch. Central Mudminnow and Brook Stickleback were also caught in the diversion channel (Table 7-2). Minnow trapping captured all Northern Redbelly Dace and two Central Mudminnow. Electrofishing captured the remaining Central Mudminnow, all Brook Stickleback and all YOY cyprinids. Body size of the YOY individuals precluded their capture within the minnow traps since they could freely swim through the mesh size.

7.2 West Creek Diversion

The West Creek Diversion fish community sampling results show multiple year classes of several species were present, a total of twelve fish species were documented and the seine net fish community abundance success metric was achieved Other gear-specific catch results show fish abundance is on track to achieving all success criteria by year-five of the monitoring program, as discussed below.

7.2.1 Stockpile Pond Fish Community Monitoring Results

A summary of the Stockpile Pond fish species caught during the 2018 field studies is provided in Table 7-3, with gear-specific and CPUE results in Table 7-4. Eleven fish species were documented in Stockpile Pond during the 2018 studies. Brown Bullhead, Northern Redbelly Dace, Finescale Dace and Creek Chub were the most abundant species, followed by Brook Stickleback, Pearl Dace and Brassy Minnow. Many YOY individuals were encountered, which were likely members of the Phoxinus genus but were too small to non-lethally confirm species (e.g., likely Finescale Dace, Northern Redbelly Dace, or hybrids of these species). Most fish older than YOY were caught in baited minnow traps, whereas the majority of seine net catch were YOY individuals representing approximately 75% of the cumulative total catch from all gear types within the pond (Table 7-4). Consequently, the high proportion of YOY individuals within Stockpile Pond influenced the CPUE of the gear-specific catch results since those smaller individuals were only catchable using seine netting.

A subsample of individuals from each species and from each gear type were measured for fork or total length for those species with rounded caudal fins. Species-specific results of these measurements, where a minimum of 100 individuals were measured, are shown on Figure 7-2 illustrating multiple age classes of Brassy Minnow, Creek Chub, Finescale Dace, Northern Redbelly Dace and Pearl Dace were present. These results confirm that Stockpile Pond functions as summer refuge, spawning, rearing and foraging habitat for these species.

7.2.2 Stockpile Diversion Channel Fish Community Monitoring Results

Available pool and flat habitats were sampled using minnow traps and backpack electrofishing; however, the riffles were mostly all dry and no measurable flow was observed within the channel. Fish within the lower reach of the diversion channel did however have unimpeded access to West Creek Pond. A summary of the Stockpile Diversion Channel fish species caught during the 2018 field studies is provided in Table 7-3, with gear-specific and CPUE results in Table 7-4. Eight fish species were documented in Stockpile Diversion Channel during the 2018 studies. Brook Stickleback, Creek Chub and juvenile White Sucker represented 84% of the total cumulative catch. Brassy Minnow, Central Mudminnow, Fathead Minnow, Finescale Dace and Pearl Dace were also caught in low abundace within the diversion channel (Table 7-4). Minnow trapping captured nearly 90% of the cumulative catch for both gear types within the

diversion channel. Electrofishing captured individuals from five of the species captured in the minnow traps.

7.2.3 West Creek Pond Fish Community Monitoring Results

A summary of the West Creek Pond fish species caught during the 2018 field studies is provided in Table 7-3, with gear-specific and CPUE results in Table 7-4. Ten fish species were documented in West Creek Pond during the 2018 studies. Pearl Dace and Brassy Minnow were the most abundant species, representing approximately 25% and 10% of the cumulative catch for all gear types within the pond, respectively. Many YOY individuals were encountered, which were likely members of the Phoxinus genus but were too small to non-lethally confirm species. Most fish were captured in baited minnow traps or by the fine mesh seine net. The majority of seine net catch were YOY individuals, representing approximately 45% of the cumulative total catch from all gear types (Table 7-4). Consequently, the high proportion of YOY individuals within West Creek Pond influenced the CPUE of the gear-specific catch results since those smaller individuals were only catchable using seine netting.

A subsample of individuals from each species and from each gear type were measured for fork or total length for those species with rounded caudal fins (e.g., Brook Stickleback and Central Mudminnow). Species-specific results of these measurements, where a minimum of 100 individuals were measured, are shown on Figure 7-3 illustrating multiple age classes of Brassy Minnow, Creek Chub, Fathead Minnow, Northern Redbelly Dace and Pearl Dace were present. These results confirm that West Creek Pond functions as overwintering and summer refuge, spawning, rearing and foraging habitat for these species.

7.2.4 West Creek Diversion Channel Fish Community Monitoring Results

Pool, flat and riffle habitats were sampled using minnow traps and backpack electrofishing; however, no measurable flow was observed within the channel and no outflow from West Creek Pond was noted. The diversion channel upstream reaaches were dry, but the lower reaches maintained sufficient water depth and connectivity to Loslo Creek. A summary of the West Creek Diversion Channel fish species caught during the 2018 field studies is provided in Table 7-3, with gear-specific and CPUE results in Table 7-4. Nine fish species were documented in West Creek Diversion Channel during the 2018 studies. Creek Chub, White Sucker and Brook Stickleback represented 33%, 19% and 14% of the total cumulative catch for both gear types within the diversion channel, respectively (Table 7-4). Minnow trapping captured eight fish species and approximately 52% of the total cumulative catch within the diversion channel. Electrofishing was conducted in other areas of the diversion channel and captured seven speices, one of which (Johnny Darter), which was not captured in the minnow traps.

7.3 Fish Community Monitoring Recommendations

The following recommendations are provided to improve fish community monitoring of the compensation measures:

- Alternate fishing methods such as boat-mounted electrofishing may be considered to improve electrofishing CPUE within the pond habitat since a boat can sample larger areas with similar effort and reach deeper (non-wadable) habitat.

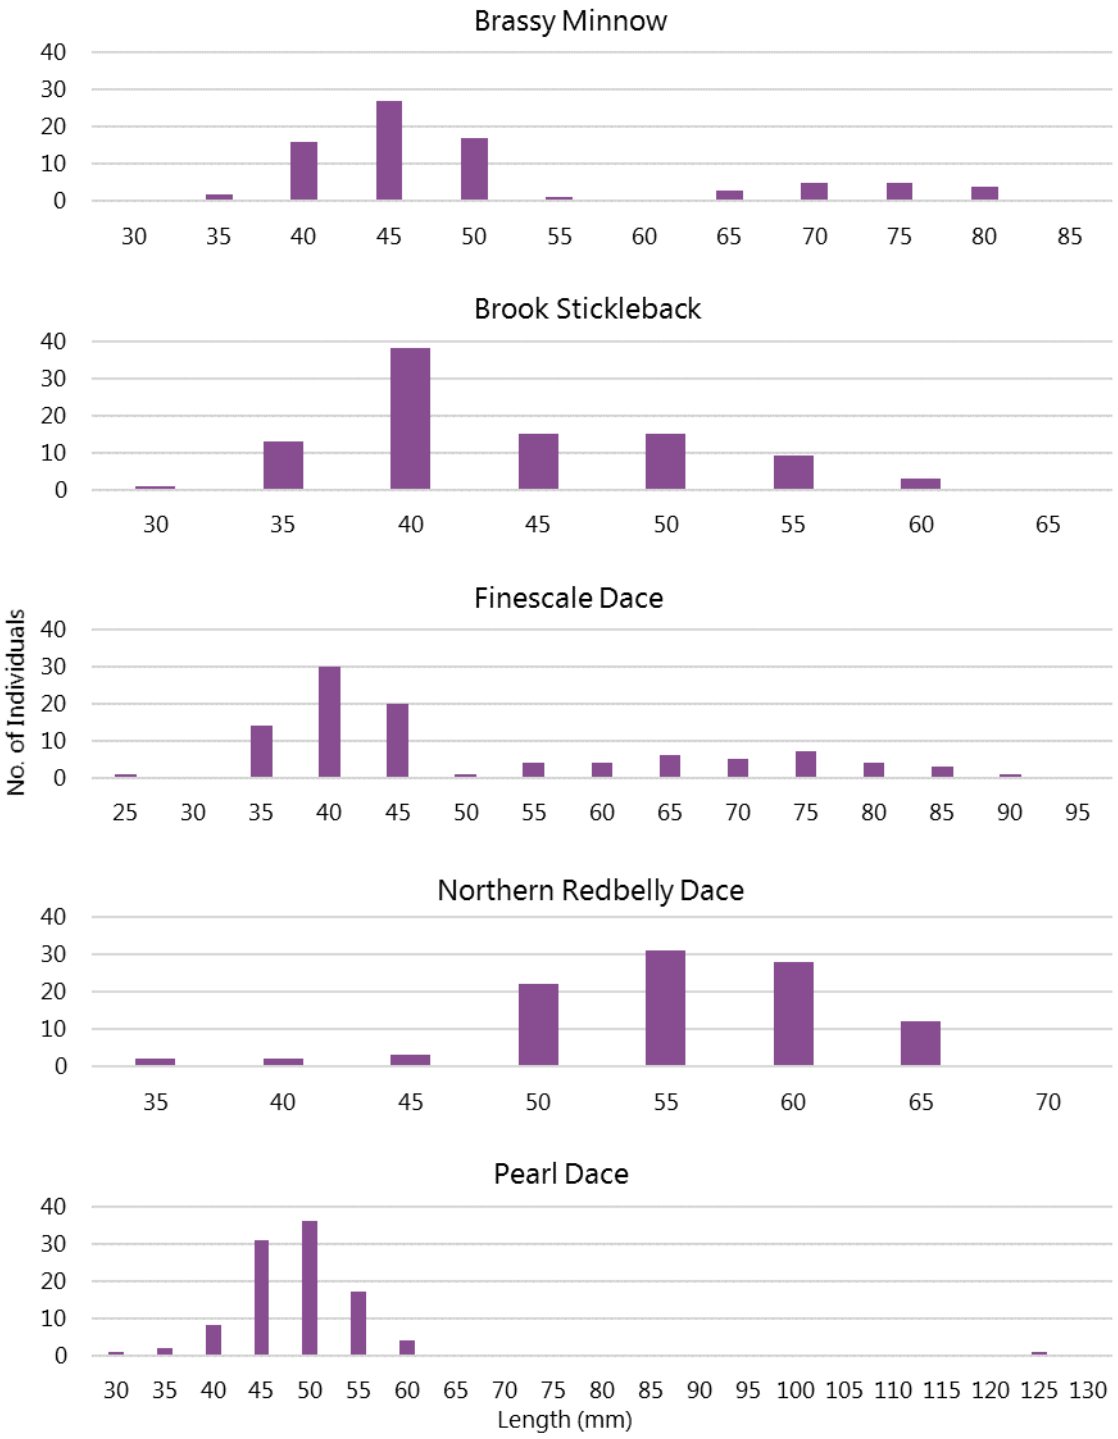

Figure 7-1: Clark Creek Pond Species-Specific Length-Frequency Summary

Note:

1. Brook Stickleback were measured for total length, all other species data represents fork length.

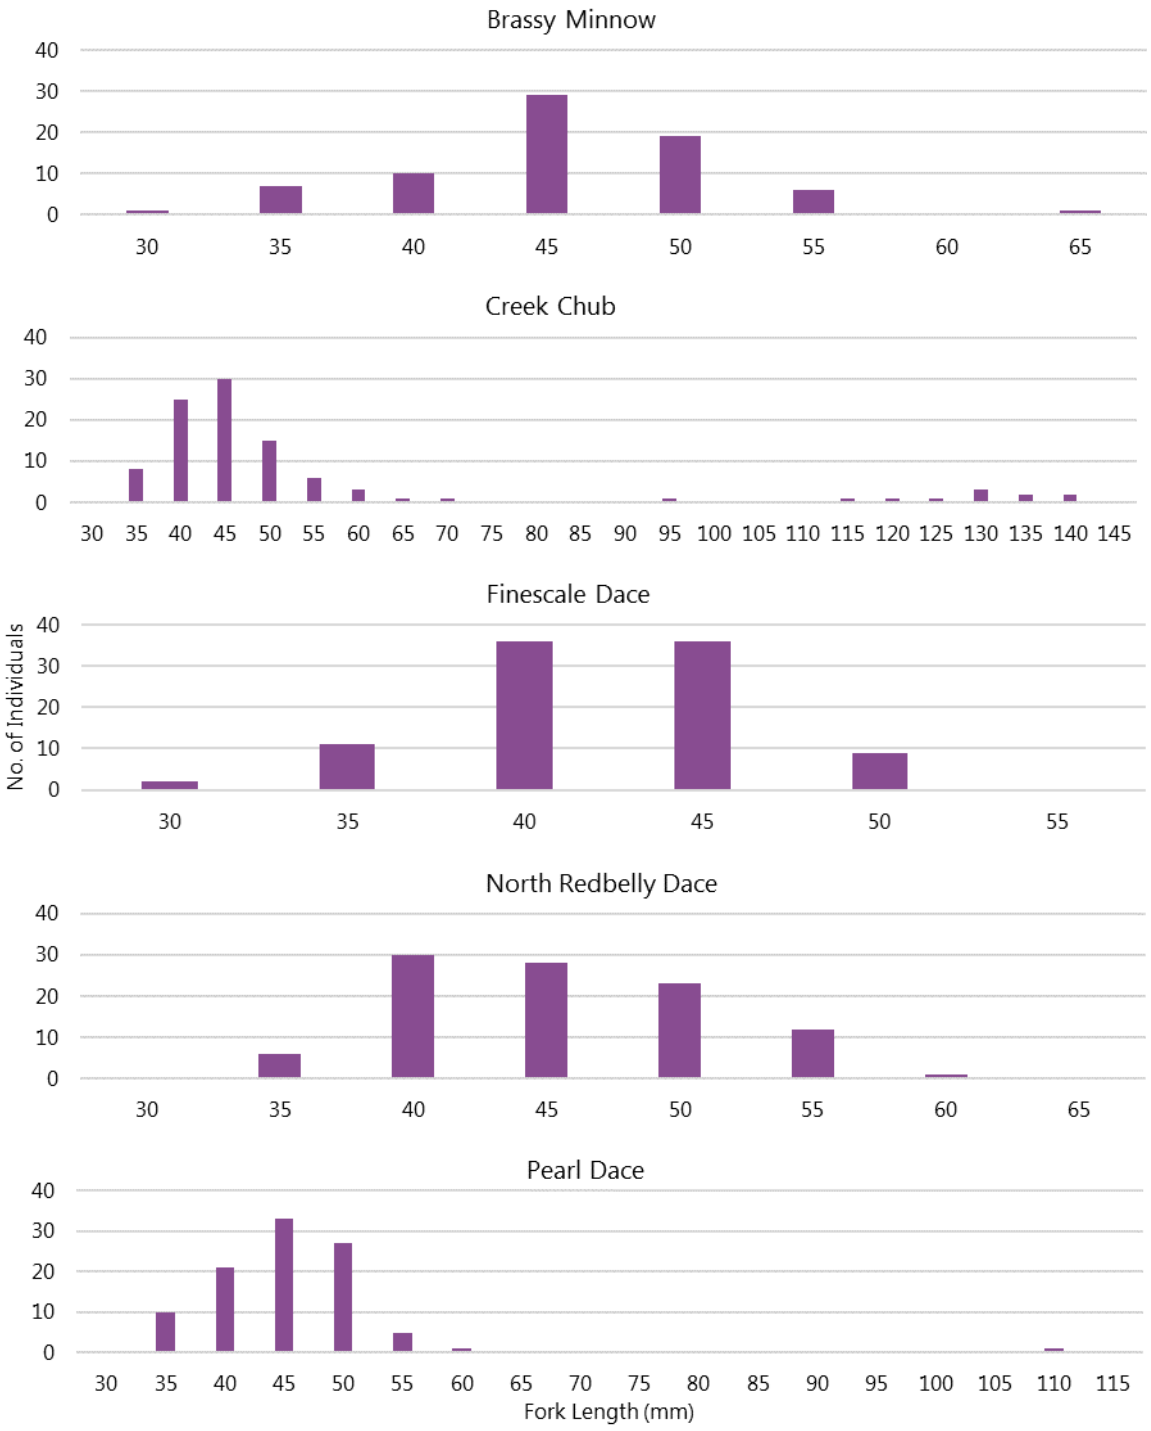

Figure 7-2: Stockpile Pond Species-Specific Length-Frequency Summary

1. CPUE - catch-per-unit-effort, expressed as the number of fish caught per gear-specific effort type
2. Minnow trap effort presented as the number of fish caught per minnow trap hour; FHCP minimum effort required for monitoring (1,500 hours in pond habitat, 250 hours in diversion habitat)
3. Seine net effort presented as the number of fish caught per 15 metre net haul; FHCP minimum effort required for monitoring (10 individual 15 m net hauls; pond habitat only)
4. Backpack electrofishing effort presented as the number of fish caught per 1,000 electrofishing seconds; FHCP minimum effort required for monitoring (10,000 seconds in pond habitat, 1,000 seconds in diversion channel habitat)
5. All gear-specific minimum required efforts were met or exceeded

8.0 Performance Summary

Implementation and effectiveness of the compensation measures are determined by confirming that the ponds and diversion channels have been constructed as per the approved plans and are functioning as intended using the success criteria specified in the approved FHCP and listed in Table 3-1. Biological systems such as Clark Creek, Stockpile and West Creek ponds and diversion channels are dynamic and will likely require several years to develop full biological communities that meet the success criteria; however, the year-one monitoring results show very good progress toward these targets.

The success criteria for physical construction and function of offset measures was achieved for Clark Creek and West Creek Diversions, although the aerial extent of Stockpile Pond and the section of Stockpile Diversion Channel between the pond outlet and West Creek Tributary 2 that have not developed as expected.

Presence of multiple year classes of fish have been demonstrated within Clark Creek and West Creek Diversions and the richness of at least nine fish species has been documented in West Creek Diversion, thereby achieving some species presence (richness) success criteria. Fish species abundance success criteria were achieved for seine netting within Clark Creek and West Creek Diversions; however, the remaining gear-specific CPUE success criteria are not yet achieved.

Further to the above, the fish catch results show thousands of YOY cyprinid individuals (seine netting catch), which will likely substantively improve the species-specific CPUE for each gear type in future studies as these individuals grow and mature into larger, spawning individuals within the population. It is anticipated that the majority of these fish will survive overwinter in refuge pools, and as such will help the population sooner attain the carrying capacity and productivity of this habitat. The 2018 performance monitoring results comparison to success criteria for Clark Creek and West Creek Diversion meaures are summarized in Tables 8-1 and 8-2, respectively.

Table 8-1: Comparison of Performance Monitoring Results to Success Criteria – Clark Creek Diversion

Attribute and Due Date	Success Criteria	Clark Creek Pond (Year-one)	Clark Creek Diversion Channel (Year-one)	Ultimate (5-year) Post Monitoring Success Criteria
Physical Construction of Offset measures (December 31, 2016)	As-built survey demonstrates that measures are constructed as per the approved plans	Yes	Yes	**Achieved**
	Area of replacement habitat is equal to or greater than 3.86 ha	Yes	Yes	**Achieved**
Physical Function of Offset Measures (December 31, 2019)	Water levels are consistent with those specified in the design	Yes	Yes	**Achieved**
	The outlet channel and pond allows for passage of fish	Yes	Yes	**Achieved**
Stability of Structures (December 31, 2019)	Constructed habitat features remain in place (log and boulder structures in place)	Yes	Yes	**Achieved**
	Shorelines and graded offset features are stable and not eroding (greater than 80% of features are considered stable)	100%	100%	**Achieved**
	Riparian vegetation cover and plantings achieve 80% coverage of area, and or survival of planted stock	>90%	>90%	**Achieved**
Species Presence (December 31, 2021)	Minimum of 9 species of fish are present in the offset measure.	7		On track
Full Life Cycle Usage (December 31, 2021)	Multiple year classes including young of the year fish are present in the offset feature.	Yes		**Achieved**
Fish Abundance (December 31, 2021)	Overall Catch per Unit Effort (CPUE) for all species combined, for at least two of following capture methods (electrofishing, Minnow Traps, Seine Nets). Minimum success criteria are:			On track
	Minnow Trap CPUE ≥ 2 fish per trap hour	0.88		On track
	Seine Net CPUE ≥ to 16 fish per 15 m net pull	172		**Achieved**
	Electrofishing CPUE ≥ 44 fish per 1,000 seconds	5.4		On track

Notes:

1. CPUE = catch-per-unit-effort, expressed as the number of fish caught per gear-specific effort type
2. Achieved = planned success criteria already achieved
3. On track = within the expected progress for the performance monitoring period
4. High proportion of YOY individuals influenced CPUE of gear-specific results since those fish were only catchable using seine netting

Table 8-2: Comparison of Performance Monitoring Results to Success Criteria – West Creek Diversion

Attribute and Due Date	Success Criteria	Ponds (Year-one)	Diversion Channels (Year-one)	Ultimate (5-year) Post Monitoring Success Criteria
Physical Construction of Offset measures (December 31, 2016)	As-built survey demonstrates that measures are constructed as per the approved plans	Yes	Yes	**Achieved**
	Area of replacement habitat is equal to or greater than 21.7 ha	Yes	Yes	**Achieved**
Physical Function of Offset Measures (December 31, 2019)	Water levels are consistent with those specified in the design	No	Approx. 75%	On track
	The outlet channel and pond allows for passage of fish	No	Approx. 75%	On track
Stability of Structures (December 31, 2019)	Constructed habitat features remain in place (log and boulder structures in place)	Yes	Yes	**Achieved**
	Shorelines and graded offset features are stable and not eroding (greater than 80% of features are considered stable)	>90%	>90%	**Achieved**
	Riparian vegetation cover and plantings achieve 80% coverage of area, and or survival of planted stock	>90%	>80%	**Achieved**
Species Presence (December 31, 2021)	Minimum of 9 species of fish are present in the offset measure.	12		**Achieved**
Full Life Cycle Usage (December 31, 2021)	Multiple year classes including young of the year fish are present in the offset feature.	Yes		**Achieved**
Fish Abundance (December 31, 2021)	Overall Catch per Unit Effort (CPUE) for all species combined, for at least two of following capture methods (electrofishing, Minnow Traps, Seine Nets). Minimum success criteria are:			
	Minnow Trap CPUE ≥ 2 fish per trap hour	1.2		On track
	Seine Net CPUE ≥ to 16 fish per 15 m net pull	397		**Achieved**
	Electrofishing CPUE ≥ 44 fish per 1,000 seconds	9.5		On track

Notes:

1. CPUE = catch-per-unit-effort, expressed as the number of fish caught per gear-specific effort type
2. Achieved = planned success criteria already achieved
3. On track = within the expected progress for the performance monitoring period
4. Assess conditions = compensation measure not progressing as expected, further investigation and assess of existing conditions required
5. High proportion of YOY individuals influenced CPUE of gear-specific results since those fish were only catchable using seine netting

9.0 Closing

We trust the information provided in this report meets the performance monitoring obligations with respect to approved Fish Habitat Compensation Plan. Should you require further details or wish to discuss any aspect of this information, please do not hesitate to contact us at your convenience.

Sincerely,

Wood Environment & Infrastructure Solutions,
a Division of Wood Canada Limited

LEGEND

BOULDER CLUSTER

TREE PILE

ZONE A - SCRUB-SHRUB WETLAND - 350 m^2

ZONE B - EMERGENT WETLAND - 12,254 m^2

NWL NORMAL WATER LEVEL

VEGETATION RESTORATION NOTES:

1. ALL AREAS EXCAVATED TO THE DEPTH OF MINERAL SOIL SHALL BE TREATED WITH A MINIMUM OF 100mm OF TOPSOIL / ORGANIC SOIL SALVAGED FROM SITE.
2. PLACED TOPSOIL SHALL BE COMPACTED UTILIZING THE TRACK WEIGHT OF A CRAWLER TRACTOR OR DOZER. FURTHER MACHINERY TRAFFIC ATOP PLACED TOPSOIL SHALL BE MINIMIZED TO PREVENT OVER-COMPACTION.
3. ANY SOIL COMPACTED DUE TO REPEATED MACHINERY ACCESS SHALL BE LOOSENED PRIOR TO SEED APPLICATION.
4. ALL DISTURBED SOILS SHALL BE STABILIZED WITH A NURSE CROP OUTLINED IN TABLE 2.
5. ZONE A AND B SHALL BE SEEDED WITH NATIVE WETLAND SEED MIX AT A RATE OF 5.5 kg/ha IN ADDITION TO NURSE CROP SEED.
6. ZONE A SHALL BE PLANTED WITH NATIVE SHRUB CUTTINGS. CUTTINGS SHALL BE PLANTED AT A 0.75m SPACING. ZONE A PLANTING AREAS SHALL BE APPROXIMATELY 10 m^2 IN SIZE AND LOCATED AS SHOWN IN THE PLAN VIEW DRAWING.
7. NATIVE SHRUB CUTTINGS SHALL BE TAKEN FROM WILLOW AND DOGWOOD SPECIES PRESENT ON SITE AND IN SURROUNDING AREA.
8. NATIVE SHRUB CUTTINGS SHALL BE HARVESTED DURING THE PLANTS' DORMANT PERIOD AND SHALL BE TREATED WITH ROOTING HORMONE PRIOR TO PLANTING.
9. NO PLANTING OR SEEDING IS REQUIRED WITHIN EXISTING BEAVER PONDS OR CONNECTING CHANNELS.
10. SUBSTITUTIONS OF PLANT MATERIAL MUST BE APPROVED BY NEW GOLD'S ENVIRONMENTAL SPECIALIST.

TABLE 1. MATERIAL SUMMARY

ZONE	MATERIAL	QUANTITY
DISTURBED AREAS	NURSE CROP SEED MIX	VARIES
A & B	WETLAND SEED MIX	6.9 kg
A	NATIVE SHRUB CUTTINGS	622
-	BOULDER CLUSTER	34
-	TREE PILE	9

CUTTINGS SHALL BE COMPRISED OF VARIOUS NATIVE WILLOW AND DOGWOOD SPECIES PRESENT ONSITE AND IN THE SURROUNDING AREA.

TABLE 2. NURSE CROP SEEDING

TIMING OF SEEDING	SELECTED SEED TYPE		
	LATIN NAME	COMMON NAME	APPLICATION RATE
POST-SPRING FRESHET TO AUG. 14	*Avena sativa*	Oats	30 kg/ha
AUG. 15 TO OCT. 15	*Triticum aestivum*	Winter Wheat	30 kg/ha

02

TABLE 3. WETLAND SEED MIX (APPLICATION RATE 5.5 kg/ha)

SPECIES	COMMON NAME	PERCENTAGE OF MIX (BY WEIGHT)
GRASSES (TOTAL 50% OF MIX)		
Glyceria grandis	Tall Manna Grass	14 %
Elymus virginicus	Virginia Wild Rye	27 %
Leersia oryzoides	Rice Cut Grass	9 %
SEDGES AND RUSHES (TOTAL 31% OF MIX)		
Carex comosa	Bristly Sedge	8 %
Carex lacustris	Lake Sedge	2 %
Carex stricta	Tussock Sedge	3 %
Juncus canadensis	Canadian Rush	6 %
Scirpus validus	Soft Stem Bulrush	8 %
Scirpus cyperinus	Woolgrass	4 %
FORBS (TOTAL 19% OF MIX)		
Acorus americanus	Sweet Flag	4 %
Alisma subcordatum	Water Plantain	4 %
Sagittaria latifolia	Broad-Leaved Arrowhead	3 %
Sparganium eurycarpum	Giant Bur Reed	8 %

NOTES:

1. ALL UNITS ARE IN METRES UNLESS OTHERWISE NOTED.
2. 1m EXISTING CONDITION CONTOURS HAVE BEEN AUTOMATICALLY GENERATED AND SMOOTHED BY AUTOCAD BASED ON LiDAR SURVEY DATA.
3. 0.5m EXISTING CONDITION CONTOURS HAVE BEEN MANUALLY SMOOTHED BASED ON LiDAR SURVEY DATA.
4. AN AMOUNT OF TOPSOIL SUFFICIENT TO COMPLETE THE WORKS SHALL BE STRIPPED FROM AREAS REQUIRING GRADING AND STOCKPILED FOR RE-USE.
5. FLOWS SHALL BE MANAGED DURING CONSTRUCTION TO MINIMIZE THE POTENTIAL FOR EROSION AND SEDIMENT TRANSPORT OFF-SITE.
6. MATERIAL GENERATED THROUGH CREATION OF REFUGE POOLS AND CONNECTOR CHANNELS SHALL BE REMOVED FROM THE POND AREA AND USED ON OTHER PORTIONS OF THE RAINY RIVER PROJECT OR CONTOURED INTO THE LANDSCAPE ABOVE THE HIGH WATER LEVEL.
7. AS-BUILT DRAWINGS PREPARED USING SURVEY PROVIDED BY NEW GOLD NOVEMBER 11 2016.

02

SUMMARY POND AREA AND WATER DEPTH:

Elevations Table						
Minimum Elevation	Maximum Elevation	Area (m^2)	% Area	Water Depth	As-Built Area (m^2)	As-Built % Area
378.65	378.75	5,640	19.2%	0.00 - 0.10	2,130	7.2%
378,50	378,65	8,403	28.5%	0.10 - 0.25	2,625	8,9%
378.25	378.50	4,810	16.3%	0.25 - 0.50	4,579	15,6%

\\Working Folders - 2018-05-11\WP\Schedule 2\As Built\Civil\207_205 - CC - Pond_Depth Locations.dwg - Plan - Dec. 14, 2018, 2:13pm - nothos.hastings

NOTES:
1. ALL UNITS ARE IN METERS UNLESS OTHERWISE NOTED.
2. 1m EXISTING CONDITION CONTOURS HAVE BEEN AUTOMATICALLY GENERATED AND SMOOTHED BY AUTOCAD BASED ON LiDAR SURVEY DATA.
3. 0.5m EXISTING CONDITION CONTOURS HAVE BEEN MANUALLY SMOOTHED BASED ON LiDAR SURVEY DATA.
4. AN AMOUNT OF TOPSOIL SUFFICIENT TO COMPLETE THE WORKS SHALL BE STRIPPED FROM AREAS RE□UIRING GRADING AND STOCKPILED FOR RE-USE.
5. FLOWS SHALL BE MANAGED DURING CONSTRUCTION TO MINIMIZE THE POTENTIAL FOR EROSION AND SEDIMENT TRANSPORT OFF-SITE.
6. SUBSURFACE PLATEAUS ARE INTENDED TO BE CONSTRUCTED UTILIZING MATERIAL GENERATED DURING EXCAVATION OF REFUGE POOLS AND CONNECTOR CHANNELS.
7. IF ADDITIONAL FILL IS RE□UIRED FOR CREATION OF SUBSURFACE PLATEAUS THEN IT SHALL BE OBTAINED FROM ADJACENT AREAS WITHIN THE POND WHICH ARE LESS THAN 1m BELOW NORMAL WATER LEVEL.
8. IF EXCESS FILL IS GENERATED THROUGH CREATION OF REFUGE POOLS AND CONNECTOR CHANNELS THEN IT MAY BE SPREAD UP TO 0.5m THICK IN AREAS WITHIN THE POND WHICH ARE GREATER THAN 2m BELOW THE NORMAL WATER LEVEL.
9. AS-BUILT DRAWINGS PREPARED BASED ON OVERALL SURVEY OF POND PROVIDED ON APRIL 29 2016 WITH SUBSURFACE PLATEAU SURVEY UPDATES PROVIDED APRIL 06 2017. SURVEY DATA FOR THE OUTLET FROM THE POND IS BASED ON UPDATED SURVEY FROM SEPTEMBER 1 2016. SURVEY DATA FOR THE POND AREA ADJACENT TO THE DAM, IN THE AREA OF THE TOE BERM IS BASED ON SURVEY FROM APRIL 25 2017.

	TREE PILE (13)		ZONE B - EMERGENT WETLAND - 8,007 m^2
NWL	NORMAL WATER LEVEL		

VEGETATION RESTORATION NOTES:

1. ALL AREAS EXCAVATED TO THE DEPTH OF MINERAL SOIL SHALL BE TREATED WITH A MINIMUM OF 100mm OF TOPSOIL / ORGANIC SOIL SALVAGED FROM SITE.
2. PLACED TOPSOIL SHALL BE COMPACTED UTILIZING THE TRACK WEIGHT OF A CRAWLER TRACTOR OR DOZER. FURTHER MACHINERY TRAFFIC ATOP PLACED TOPSOIL SHALL BE MINIMIZED TO PREVENT OVER-COMPACTION.
3. ANY SOIL COMPACTED DUE TO REPEATED MACHINERY ACCESS SHALL BE LOOSENED PRIOR TO SEED APPLICATION.
4. ALL DISTURBED SOILS SHALL BE STABILIZED WITH A NURSE CROP OUTLINED IN TABLE 2.
5. ZONE A AND B SHALL BE SEEDED WITH NATIVE WETLAND SEED MIX AT A RATE OF 5.5 kg/ha IN ADDITION TO NURSE CROP SEED.
6. ZONE A SHALL BE PLANTED WITH NATIVE SHRUB CUTTINGS. CUTTINGS SHALL BE PLANTED IN CLUMPS OF 3 - 12 AT A 0.75m SPACING. A TOTAL OF 15-25% OF ZONE A SHALL BE PLANTED WITH THESE CUTTINGS.
7. NATIVE SHRUB CUTTINGS SHALL BE TAKEN FROM WILLOW AND DOGWOOD SPECIES PRESENT ON SITE AND IN SURROUNDING AREA.
8. NATIVE SHRUB CUTTINGS SHALL BE HARVESTED DURING THE PLANT'S DORMANT PERIOD AND SHALL BE TREATED WITH ROOTING HORMONE PRIOR TO PLANTING.
9. NO PLANTING OR SEEDING IS RE□UIRED WITHIN EXISTING BEAVER PONDS OR CONNECTING CHANNELS.
10. SUBSTITUTIONS OF PLANT MATERIAL MUST BE APPROVED BY NEW GOLD'S ENVIRONMENTAL SPECIALIST.

Limitations

Limitations

1. The work performed in the preparation of this report and the conclusions presented are subject to the following:
    a. The Standard Terms and Conditions which form a part of our Professional Services Contract;
    b. The Scope of Services;
    c. Time and Budgetary limitations as described in our Contract; and
    d. The Limitations stated herein.
2. No other warranties or representations, either expressed or implied, are made as to the professional services provided under the terms of our Contract, or the conclusions presented.
3. The conclusions presented in this report were based, in part, on visual observations of the Site and attendant structures. Our conclusions cannot and are not extended to include those portions of the Site or structures, which are not reasonably available, in Wood's opinion, for direct observation.
4. The environmental conditions at the Site were assessed, within the limitations set out above, having due regard for applicable environmental regulations as of the date of the inspection. A review of compliance by past owners or occupants of the Site with any applicable local, provincial or federal bylaws, orders-in-council, legislative enactments and regulations was not performed.
5. The Site history research included obtaining information from third parties and employees or agents of the owner. No attempt has been made to verify the accuracy of any information provided, unless specifically noted in our report.
6. Where testing was performed, it was carried out in accordance with the terms of our contract providing for testing. Other substances, or different quantities of substances testing for, may be present on-site and may be revealed by different or other testing not provided for in our contract.
7. Because of the limitations referred to above, different environmental conditions from those stated in our report may exist. Should such different conditions be encountered, Wood must be notified in order that it may determine if modifications to the conclusions in the report are necessary.
8. The utilization of Wood's services during the implementation of any remedial measures will allow Wood to observe compliance with the conclusions and recommendations contained in the report. Wood's involvement will also allow for changes to be made as necessary to suit field conditions as they are encountered.
9. This report is for the sole use of the party to whom it is addressed unless expressly stated otherwise in the report or contract. Any use which any third party makes of the report, in whole or the part, or any reliance thereon or decisions made based on any information or conclusions in the report is the sole responsibility of such third party. Wood accepts no responsibility whatsoever for damages or loss of any nature or kind suffered by any such third party as a result of actions taken or not taken or decisions made in reliance on the report or anything set out therein.
10. This report is not to be given over to any third party for any purpose whatsoever without the written permission of Wood.
11. Provided that the report is still reliable, and less than 12 months old, Wood will issue a third-party reliance letter to parties that the client identifies in writing, upon payment of the then current fee for such letters. All third parties relying on Wood's report, by such reliance agree to be bound by our proposal and Wood's standard reliance letter. Wood's standard reliance letter indicates that in no event shall Wood be liable for any damages, howsoever arising, relating to third-party reliance on Wood's report. No reliance by any party is permitted without such agreement.

EXECUTIVE SUMMARY

New Gold Inc. (New Gold) is currently constructing and operating, and eventually plans to reclaim a new open pit and underground gold mine in Chapple Township, Ontario. As part of commitments made during the environmental approvals process, New Gold conducted a second White-tailed Deer tissue and organ sampling program in 2017 to determine concentration levels of various contaminants such as metals (e.g., cadmium, copper and zinc) and cyanide within deer located near the Rainy River Mine (RRM). This, in addition to future sampling conducted will aid in determining exposure and ecological risk to wildlife, if any, from RRM related contaminants. The study will also assist in determining if there are risks to humans that consume local wildlife.

Sampling kits were distributed by New Gold RRM to collect deer tissue and liver samples from hunters on a voluntary basis. Tissues were also sampled from three deer that died from vehicle collisions, and liver tissue only was sampled from one deer which was killed by an unidentified poacher (a pile of viscera was found just north of the RRM on Richardson Road). There was no harvesting of deer solely for the purpose of this program to the knowledge of RRM. Samples from 36 deer were analyzed for several metals and 30 of those were analyzed for cyanide as well. A Spearman Correlation test was completed on each of the tested parameters to determine if there was a significant relationship between the contaminant concentration and the distance from the RRM. A Kruskal-Wallis test was completed on the 2016 and 2017 datasets to determine if the sample concentrations for each of the parameters differed significantly between the data collection years.

As seen in in the various graphs presented in this report, none of the contaminants exhibited a statistically significant relationship between concentration levels and proximity to the RRM boundary. This is likely attributable to the high variances associated with most of the parameters measured, whereby the standard deviations ranged from 0 to 793 3g/kg ww.

Most potential contaminant concentration levels did not differ significantly from the baseline data. However, arsenic, bismuth, cesium, copper, lithium, and magnesium concentration levels did exhibit significant differences ($P<0.05$) from the 2016 baseline concentration levels for those parameters.

There are very few similar studies in Canada or in North America which provide contaminant information from healthy White-tailed Deer populations that can be used as a baseline comparison for this study. It is also difficult to make comparisons at large geographic scales (e.g., outside Ontario or outside of Canada) as different ecological factors and human activities can result in different contaminant concentrations between populations. Accordingly, New Gold will use the 2016 data as baseline data for comparisons of concentration levels in deer tissue in future years (e.g., after operations have commenced and post-closure), rather than relying on comparisons to contaminant concentration levels in other studies.

1.0 INTRODUCTION

1.1 Project Background

New Gold Inc. (New Gold) is currently operating an open pit gold mine producing doré bars (gold with silver) for sale. Construction of the underground gold mine is in progress, with future plans to reclaim both the open pit and underground operational areas (Figure 1-1).

Physical works related to the RRM consist primarily of:

- Open pit;
- Underground mine (under construction);
- Overburden, mine rock and low-grade ore stockpiles;
- Primary crusher and process plant;
- Tailings management area;
- 230 kilovolt transmission line;
- Relocation of a portion of gravel-surfaced Highway 600; and
- Associated buildings, facilities and infrastructure.

Development of the RRM was initiated in 2015 following completion of the Environmental Assessment process and receipt of applicable environmental approvals. In accordance with the *Canadian Environmental Assessment Act, 2012* (CEAA, 2012) a follow-up monitoring plan was developed to verify the accuracy of the predictions made in the Environmental Assessment about the impacts of the RRM on wildlife and wildlife habitat, and to monitor the effectiveness of rehabilitation efforts for wildlife habitat and terrestrial environments.

As part of the overall follow-up monitoring plan, and to address concerns that dust from the project will settle on the vegetation deer will be eating (and thus carry the contaminants up the food chain) New Gold RRM committed to a White-tailed Deer (*Odocoileus virginianus*) tissue and organ sampling program. This program will determine exposure and ecological risk to wildlife from mine-related contaminants and confirm the low risks to humans that consume local wildlife.

1.2 Objective and Scope

Metals such as cadmium, copper and zinc are naturally-occurring in the environment but may also be released to the environment in an enhanced manner through anthropogenic activities. Plant-eating animals, such as deer, are susceptible to ingesting unnaturally high levels of contaminants by feeding in areas exposed to industrial activities. Plants can absorb metals from soil or become coated by microscopic airborne contaminants from dust and industrial emissions. Airborne contaminants can be carried long distances by winds before they are deposited at ground level, while dust generated along roads tends to remain more localized. This dust may have a more concentrated effect on nearby plants, and subsequently, on the animals that consume these plants. Both of these sources of contaminants have the potential to harm the

health of the animals that consume affected plants, as well as potentially the health of humans who consume these animals.

Preliminary results of the tissue sampling for the White-tailed Deer population located to close to the RRM are presented in this report. These data have been compared to the 2016 study results to aid in determining exposure and ecological risk to local wildlife from mine-related contaminants and assessing the risks to humans that consume local wildlife if any.

2.0 METHODOLOGY

2.1 Sample Collection

A tissue collection program was developed by New Gold in 2016 to test for metal and cyanide concentrations in White-tailed Deer. Sampling kits were provided to interested parties in 2016. Sampling kits were again distributed to interested parties during the 2017 deer hunting season to collect liver and muscle tissue samples from hunters on a voluntary basis. Tissues were also sampled from three deer that died in vehicle collisions (D004, D009, and D027) and liver tissue only was sampled from one deer which died in an unknown manner (D028; a pile of viscera was found just north of the RRM on Richardson Road). There was no harvesting of deer solely for the purpose of this program to the knowledge of New Gold RRM. Tissue and organ samples were collected from 36 deer at harvest locations shown in Figure 2-1.

Detailed information about each animal the samples were collected from was collected, including:

- Date harvested;
- Weather;
- Name and contact details of sample provider;
- Location of harvest;
- Tag number;
- Deer sex, age and physical condition;
- Time of harvest and time of sample collection;
- Type of harvest (firearm or crossbow);
- Location of shot (injury); and
- Any additional comments.

Table 2-1 provides the sample identification number with the relevant sex, age and type of harvest for the specimens described in this report.

2.2 Analyses

Construction of the RRM began in the winter of 2015, and operations and production started in mid-2017. Consequently, the 2017 data presented in this report represent early operational data levels for the local deer population. The 2017 data will be compared herein to the baseline data levels collected in 2016. Tissue and organ sample collection will be conducted again in 2018, and then planned for every three years through the operations phase until the closure of the RRM. If contaminant levels are found to increase problematically, the frequency of the program will be changed to annual sampling and mitigation measure will be determined and implemented. The results of these future sampling periods will also be compared to the 2016 baseline levels.

2.3.1 Chemical Analyses

Deer tissue and organ samples were sent to ALS Environmental Labs in Mississauga, Ontario for metal and cyanide analysis. Liver samples were analyzed for a suite of metals and muscle tissue was analyzed for cyanide. All metals other than mercury were tested for using an Inductively Coupled Plasma Mass Spectrometry (ICPMS) test (wet). Mercury was tested for using a Cold Vapour Atomic Fluorescence Spectroscopy (CVAFS) test (wet). The tests for metals were conducted following the British Columbia Lab Manual method described in *Metals in Animal Tissue and Vegetation (Biota) – Prescriptive*. Tissues samples were homogenized and sub-sampled prior to hotblock digestion with nitric acid, hydrochloric acid and hydrogen peroxide. For the ICPMS, analysis was by collision cell inductively coupled plasma – mass spectrometry, modified from United States Environmental Protection Agency (US EPA) Method 6020A. The CVAFS analysis uses atomic fluorescence spectrophotometry or atomic absorption spectrophotometry, adapted from US EPA Method 245.7.

2.3.2 Statistical Analyses

Low concentrations of contaminants cannot always be precisely measured. Concentrations that are too low to be measured are said to be below the Lowest Detection Limit (LDL) and as such range from 0 to the LDL value itself. In statistical analyses these values are often substituted with a constant value such as the LDL, half of the LDL, or 0. For the purposes of this study, concentrations that were below the LDL were assumed to be 0.

Statistics were calculated using Systat 13® software. Descriptive statistics, such as mean, maximum, minimum, median, and standard deviation values were calculated for each potential contaminant analyzed in this study. Descriptive statistics of skewness and kurtosis were used to assess data normality. Log-transformations were unsuccessful in normalizing the data sets. Consequently, non-parametric statistical testing was used. The Spearman correlation analysis was completed to determine the strength and direction of the relationship between the analyte concentration and the distance from the RRM, expressed as the Spearman Rho statistic (r_s). The Spearman correlation analysis was selected since there is no requirement for normality. The r_s absolute values range between 0 and 1, whereby the closer the r_s is to 0, the weaker the relationship. Directionality of the relationship is inferred by either a positive or negative r_s. Consequently, an increase in the contaminant concentration with increased distance from the RRM would be expressed as a positive r_s, while a decrease in concentration of a contaminant with increased distance from the RRM would be expressed as a negative r_s. The following distinctions between r_s ranges were used in this study to describe the strength of the relationship between the analyte and the distance from the RRM:

r_s = 0.00-0.19 indicates a very weak relationship;
r_s = 0.20-0.39 indicates a weak relationship;
r_s = 0.40-0.59 indicates a moderate relationship;
r_s = 0.60-0.79 indicates a strong relationship; and
r_s = 0.80-1.0 indicates a very strong relationship.

No test for significance was performed on the r_s values since all of the relationships between analyte and distance from the RRM were interpreted as very weak or weak.

The nonparametric Kruskall-Wallis test was completed to compare the 2017 parameter concentrations with those recorded in 2016 ($P<0.05$).

3.0 RESULTS

Raw data for each contaminant and each sample as analyzed by ALS Environmental Labs are presented in Appendix A.

3.1 Sample Collection

Due to the nature of the study (e.g., samples were provided voluntarily by hunters) there was no control over the locations, or the distribution of locations, from which the 36 deer samples were collected. Many of the animals were harvested within 20 km of the RRM boundary and are distributed in a useful pattern for analysing distances from the RRM boundary:

- 14% of the samples were collected within 5 km of the boundary;
- 58% were collected within 10 km; and
- 75% were collected within 20 km of the boundary.

More distant samples were taken between 21 km and 37 km from the Project boundary as well as the furthest sample which was taken approximately 335 km from the Project boundary.

Samples D019 and D030 were harvested near mineral troughs for cattle, and in many cases in the results below, D019 and D030 have elevated concentrations; it is possible that the source of these elevated concentrations is from foraging in the cattle mineral troughs.

3.2 Concentrations of Contaminants

Most the potential contaminants tested were detected in the tissue samples (Table 3-1). The exceptions were beryllium and bismuth, which were below the LDL for all of the 2017 samples analyzed. On average, 34.3% of the samples fell below the LDL for the potential pollutants tested.

Descriptive statistics are presented in Table 3-1, with the mean, median, maximum, minimum, standard error (SE), standard deviation (SD), skewness, and kurtosis for each of the potential contaminants. Approximately 30.3% of the datasets did not conform to the assumptions of normality and attempts at log transformations were unsuccessful at normalizing these data. Consequently, non-parametric testing was used to assess relationships within and between datasets. Figure 3-1 illustrates potential contaminant concentrations found in the 36 deer samples from the RRM The samples have been plotted relative to the distance between the deer tissue

harvest location (Figure 2-1) and the boundary of the RRM. The relationship between contaminant concentration and distance to the RRM is discussed in Section 3.2.

Slightly more than one third (36.4%) of the potential contaminants differed significantly ($P<0.05$) from their 2016 baseline concentrations (Table 3-2). The small sample sizes (n=38 in 2016 and n=36 in 2017) and lack of baseline metal contamination values for White-tailed Deer in literature make it difficult to clearly demonstrate expected normal values. Trends in contaminant concentration levels will become clearer as more data are collected in subsequent years.

A comparison between the 2016 and 2017 contaminant concentrations revealed that approximately 37% of the 2017 parameter concentrations differed significantly ($P<0.05$) from the baseline concentrations measured in 2016 (Table 3-2). Concentrations of arsenic, bismuth, cesium, copper, lithium, mercury, nickel, rubidium, selenium, strontium, and cyanide concentrations were significantly lower in the tissue samples compared with the 2016 baseline concentrations for those analytes. Only sodium concentrations were significantly higher than the 2016 baseline concentrations. With limited samples (n=38 in 2016 and n=36 in 2017) resulting in large variations, any inferences to causation would be speculative. As mentioned above, trends are expected to become established with the collection of more data during subsequent sampling rounds.

The results for each contaminant are discussed briefly below with a brief comparison to 2016 baseline data.

Aluminum

Aluminum is the most abundant metal in the earth's crust and is found commonly in bedrock and unconsolidated surficial sediments/soil as well as groundwater and can be introduced into the environment by burning coal (United States Department of the Interior 2016; Agency for Toxic Substances and Disease Registry 2017). Aluminum is found to be locally elevated naturally in surface water both on and off the RRM site (personal communication with Nathan Baird).

Aluminum has a LDL of 0.40 milligrams per kilogram wet weight (mg/kg ww). Most of the 2017 values for this metal in deer tissues for the RRM study were near the LDL for aluminum, with 61.1% of the samples having non-detectable levels (the value is less than the LDL). The highest aluminum concentrations are 2.63 mg/kg ww, 3.63 mg/kg ww and 4.22 mg/kg ww from samples D018, D028 and D020, respectively.

Results of the Kruskal-Wallis test indicate that aluminum concentrations did not differ significantly between 2016 and 2017 deer tissue samples ($P=0.447$).

Antimony

Antimony is naturally present in the earth's crust in bedrock, soil and waterbodies (i.e., lakes and rivers) although it is generally found in low concentrations (Agency for Toxic Substances and

Disease Registry 2017; United States Department of the Interior 2016). Antimony can also enter the environment through various human activities including: coal-fired power plants, copper smelters and inorganic chemical plants (CCREM nd).

Antimony has a LDL of 0.002 mg/kg ww and most of the samples contained concentrations of this element at or below the LDL (i.e., 88.9% less than the LDL). The remainder of the concentrations in the samples ranged from 0.0025 mg/kg ww to 0.0061 mg/kg ww which are considered to be low (close to the LDL).

Results of the Kruskal-Wallis test indicate that antimony concentrations did not differ significantly between 2016 and 2017 deer tissue samples (P=0.075).

Arsenic

Arsenic is a widely distributed element found naturally in the earth's crust in soil and minerals and the largest natural source of arsenic entering surface waters is that from weathered rocks and soils (Nriagu 1989 in CCME 2017). Arsenic is used in metallurgical applications, wood preservatives, herbicides, pharmaceutical and glass manufacturing (Government of Canada 1993). As arsenic was historically widely used in pesticides, agricultural areas where it was used can have high levels in soils (United States Department of the Interior 2016; Agency for Toxic Substances and Disease Registry 2017).

The LDL for Arsenic is 0.004 mg/kg ww; 75.0% of the samples in this study had concentrations less than the LDL and the remainder of the concentrations in samples ranged from 0.004 mg/kg ww to 0.022 mg/kg ww. Two samples (D004 and D017) had relatively high concentrations (i.e., within the highest 25th percentile) of 0.0220 mg/kg ww, and 0.0175 mg/kg ww, respectively.

Results of the Kruskal-Wallis test indicate that arsenic concentrations were significantly lower in the 2017 deer tissues samples compared with the 2016 baseline concentrations (P=0.000).

Barium

Barium is found naturally in some rocks and soils, and can be introduced to air and water by natural weathering processes. Some vegetation types are known to accumulate barium. Barium minerals and compounds are widely used in industry. Barium is used as a filler in such anthropogenic substances such as: paint, bricks, glass, rubber and insect / rodent poisons, and could enter the environment from the manufacturing or disposal of these products (United States Department of the Interior 2016; Agency for Toxic Substances and Disease Registry 2017).

All of the deer tissue samples had detectable levels of barium (LDL of 0.01 mg/kg ww), ranging from 0.016 mg/kg ww to 0.105 mg/kg ww. The highest barium concentration values are 0.105 mg/kg ww, 0.082 mg/kg ww, and 0.078 mg/kg ww from samples D019, D020, D001, respectively.

Results of the Kruskal-Wallis test indicate that barium concentrations did not differ significantly between 2016 and 2017 deer tissue samples (P=0.452).

Beryllium

Beryllium occurs naturally in some rocks including coal and soil, although generally in low levels in Canada (CCREM nd). Natural weathering of soil and rocks causes it to enter water sources and it can accumulate in some plants. It is also released into the environment when coal or oil are burned or improperly disposed of (United States Department of the Interior 2016; Agency for Toxic Substances and Disease Registry 2017).

There were no 2017 samples with beryllium concentrations above the respective LDL of 0.002 mg/kg ww.

Results of the Kruskal-Wallis test indicate that beryllium concentrations did not differ significantly between 2016 and 2017 deer tissue samples (P=1.000).

Bismuth

Bismuth is a naturally occurring metal in the earth's crust. Bismuth can be released into soil and water by natural weathering processes (Salminen et al. 2005).

There were no samples with bismuth above the respective LDL of 0.002 mg/kg ww.

Results of the Kruskal-Wallis test indicate that bismuth concentrations were significantly lower in the 2017 deer tissue samples compared with the 2016 baseline concentrations (P=0.000).

Boron

Boron is a widely occurring metal in the earth's crust. Due to the extensive occurrence of boron in clay-rich sediments and sedimentary rocks, most boron found in surface soils and waters results from weathering of natural sources. Boron can accumulate in some plants. Boron is also widely used in fertilizers and pesticides so agricultural areas can have high levels in the soils (Agency for Toxic Substances and Disease Registry 2017).

Boron has a LDL of 0.2 mg/kg ww. Almost half (47.2%) of the tissue samples had non-detectable concentration levels of boron, with the remaining values ranging from 0.21 to 0.35 mg/kg ww.

Results of the Kruskal-Wallis test indicate that boron concentrations did not differ significantly between 2016 and 2017 deer tissue samples (P=0.242).

Cadmium

Cadmium occurs naturally in rocks including coal and petroleum, and can enter water or soil when it is broken down by acidic water such as acid precipitation. Some areas naturally contain elevated concentrations of cadmium in underlying rock, with the spatial variation related to both rock composition and other natural processes. As cadmium is used in such items as batteries, plastics and pesticides (CCME 2017), it can also enter the environment from anthropogenic means including from landfills or incineration. Cadmium is known to accumulate in plants, including agricultural crops although the uptake rates will depend on the plant species (United States Department of the Interior 2016; Agency for Toxic Substances and Disease Registry 2017; CCME 2015).

All of the deer tissue samples had detectable levels of cadmium (LDL of 0.001 mg/kg ww), ranging from 0.0011 mg/kg ww to 1.89 mg/kg ww. The four highest cadmium concentrations reported were 1.89 mg/kg ww (sample D008), 1.59 mg/kg ww (sample D036), 1.2 mg/kg ww (sample D006) and 1.16 mg/kg ww (sample D017).

Results of the Kruskal-Wallis test indicate that cadmium concentrations did not differ significantly between 2016 and 2017 deer tissue samples (P=0.087).

Calcium

Calcium is the third most abundant metal in the earth's crust and can be found naturally in rocks, minerals, and in all plants and animals. It is readily soluble in water and as a result, enters the environment through the weathering of rocks, especially limestone (CCREM nd).

All of the deer tissue samples from the RRM had detectable levels of calcium (LDL of 4 mg/kg ww), ranging from 12.7 mg/kg ww to 76.4 mg/kg ww. The lowest concentration of 12.7 mg/kg ww is considerably lower than the rest of the values.

Results of the Kruskal-Wallis test indicate that calcium concentrations did not differ significantly between 2016 and 2017 deer tissue samples (P=0.143).

Cesium

Cesium occurs naturally in rocks, soil and mineral and can enter water and air by natural erosion and weathering processes. Anthropogenic sources of cesium include nuclear power plants and other nuclear operations (Agency for Toxic Substances and Disease Registry 2017).

Cesium has a LDL of 0.001 mg/kg ww. All of the samples had detectable levels of cesium, ranging from 0.0024 mg/kg ww to 0.104 mg/kg ww. The maximum result of 0.104 mg/kg ww (D030) is substantially higher than then the next highest concentration detected of 0.73 mg/kg ww (D036).

Results of the Kruskal-Wallis test indicate that cesium concentrations in the 2017 deer tissues were significantly lower compared with the 2016 baseline concentrations (P=0.009).

Chromium

Chromium us a naturally occurring element in rocks, soil, water, air, plants and animals. In rocks and soil, it is generally found as an insoluble oxide (CCME 2017). Anthropogenic sources of chromium in the environment include fossil fuel combustion, cement manufacturing, incineration and from industries such as ferrochromium production and electroplating (United States Department of the Interior 2016; Agency for Toxic Substances and Disease Registry 2017; CCME 2017).

Chromium has a LDL of 0.01 mg/kg ww. Most (i.e., 83.3%) of the deer tissue samples had detectable concentration levels of chromium, with values ranging from 0.01 mg/kg ww to 0.36 mg/kg ww. The highest concentrations of chromium were detected in D017, D018, and D022, with concentrations measuring 0.36 mg/kg ww, 0.31 mg/kg, and 0.33 mg/kg, respectively.

Results of the Kruskal-Wallis test indicate that chromium concentrations did not differ significantly between 2016 and 2017 deer tissue samples (P=0.317).

Cobalt

Cobalt occurs naturally in many rock types, and accordingly, is present in soil, water, plants and animals. Anthropogenic sources of cobalt in the environment including coal burning, other industries, fertilizers, and vehicle exhaust (CCREM nd; Agency for Toxic Substances and Disease Registry 2017).

All but two of the deer tissue samples (94.4%) had detectable concentrations of cobalt (LDL of 0.004 mg/kg ww). Concentrations of cobalt in the deer tissue samples ranged from 0.0041 mg/kg ww to 0.0943 mg/kg ww. While most of the samples had similar concentrations of this element, elevated cobalt concentrations were detected in several samples. Samples D013 and D036 exhibited the levels of cobalt in their tissues, with samples reaching concentrations of 0.0943 mg/kg ww and 0.0806 mg/kg ww, respectively.

Results of the Kruskal-Wallis test indicate that cobalt concentrations did not differ significantly between 2016 and 2017 deer tissue samples (P=0.600).

Copper

Copper is a common, naturally occurring metal in rocks and minerals of the earth's crust and is found in surface soil, water, sediments, air, plants and animals. Major industrial sources include copper mining, smelting and refining industries, wire mills, coal-burning industries, and iron- and steel-producing industries (CCREM nd). As well as from industrial discharges and emissions,

copper also enters the environment naturally from decaying plants and forest fires (United States Department of the Interior 2016; Agency for Toxic Substances and Disease Registry 2017).

All of the tissue samples had detectable levels of copper, ranging from 0.574 mg/kg ww to 173 mg/kg ww (LDL of 0.020 mg/kg ww). Only four of the 36 samples (11.1%) had copper concentrations below 4 mg/kg ww (D016, D019, D020, and D032). The highest concentrations measured were from samples D007, D013, and D017, with copper concentrations of 173 mg/kg ww, 101 mg/kg ww, and 100 mg/kg ww, respectively.

Results of the Kruskal-Wallis test indicate that copper concentrations were significantly lower in the 2017 deer tissue samples compared with the 2016 baseline concentrations (P=0.012).

Iron

Iron is a naturally occurring metal found in minerals and is the fourth most abundant element in the earth's crust. It is released into soil and water by the natural weathering of rocks and is commonly present. Iron can also be introduced into the environment from human activities, including from burning of coal, acid mine drainage, mineral processing, landfill leachates, iron-related industries, and the corrosion of iron and steel (CCREM nd).

All of the deer tissue samples from the RRM had detectable levels of iron (i.e., >0.6 mg/kg ww), ranging from 49.3 mg/kg ww to 990 mg/kg ww. The two highest concentrations (871 mg/kg ww and 990 mg/kg ww, samples D019 and D032, respectively) were substantially higher than the next highest value of 396 mg/kg ww (D016).

Results of the Kruskal-Wallis test indicate that iron concentrations did not differ significantly between 2016 and 2017 deer tissue samples (P=0.709).

Lead

Lead is a naturally occurring metal in the earth's crust. Most of the lead in the environment however, comes from human activities rather than the weathering of lead-containing rock (CCREM nd). The historic use of gasoline and pesticides containing lead caused large amounts to enter the environment. Lead binds to soil and will stay in an area for many years. Other sources of lead in the environment are burning fossil fuels, incineration, leaching from plumbing and weathering of paint (Agency for Toxic Substances and Disease Registry 2017).

The LDL for lead is 0.0040 mg/kg ww and 38.9% of the samples had non-detectable levels of lead. The remainder of the results range from 0.0046 mg/kg ww to 0.131 mg/kg ww. The highest lead concentration levels were recorded in samples D002, D011, and D030, with concentrations measuring 0.131 mg/kg ww, 0.0655 mg/kg ww, and 0.0354 mg/kg, respectively

Results of the Kruskal-Wallis test indicate that lead concentrations did not differ significantly between 2016 and 2017 deer tissue samples (P=0.157).

Lithium

Lithium naturally occurs in rocks and can be introduced to water and soils by natural weathering processes. Human activities also introduce lithium into the environment such as through the disposal of batteries, as well as coal combustion and aluminum product production (Salminen et al. 2005; Yalamanchali 2012; CCREM nd). Lithium compounds are readily soluble; and is easily taken up and accumulated in plants (CCREM nd; Yalamanchali 2012; Lenntech 2017).

Lithium has a LDL of 0.10 mg/kg ww. Fifty percent (50%) of the samples had non-detectable levels of lithium. The rest of the sample lead concentrations ranged from 0.11 mg/kg ww to 0.72 mg/kg ww. Four samples contained elevated lithium concentrations. D002, D003, D004, and D010 tissues contained 0.52 mg/kg ww, 0.59 mg/kg ww, 0.53 mg/kg ww, and 0.72 mg/kg ww of lead, respectively.

Results of the Kruskal-Wallis test indicate that lithium concentrations were significantly lower in the 2017 tissue samples compared with the 2016 baseline concentrations (P=0.003).

Magnesium

Magnesium is a common naturally occurring element in the earth's crust and is found in many different rock types, including dolomite which is commonly quarried and used as an aggregate. It is used in a variety of industry applications, including: textiles, paper, refractories, ceramics and fertilizers. Magnesium is considered to be an essential element for all organisms and may be accumulated in in calcareous tissues (CCREM nd).

All of the samples had detectable concentrations (i.e., >0.4 mg/kg ww) of magnesium ranging from 47.3 mg/kg ww to 325 mg/kg ww. The highest concentration of magnesium (325 mg/kg ww; D030) was substantially higher than the next highest concentration detected (205 mg/kg ww; D013). While 97.2% of the samples contained magnesium concentrations above 100 mg/kg ww, one sample (D019) contained only 47.3 mg/kg ww of magnesium in its tissue.

Results of the Kruskal-Wallis test indicate that magnesium concentrations did not differ significantly between 2016 and 2017 deer tissue samples (P=0.169).

Manganese

Manganese occurs naturally in mineral form from sediments and rocks, and is taken up and accumulated by some plants. As it is used in the steel and chemical industries, manganese can also be released from emissions and waste disposal (United States Department of the Interior 2016; Agency for Toxic Substances and Disease Registry 2017; CCREM nd).

All of the samples had detectable levels (LDL of 0.010 mg/kg ww) of manganese, ranging from 0.066 mg/kg ww to 4.35 mg/kg ww. D013, D023, and D027 yielded the highest manganese

concentrations in their tissues, with concentrations of 4.05 mg/kg ww, 4.26 mg/kg ww, and 4.35 mg/kg ww, respectively.

Results of the Kruskal-Wallis test indicate that manganese concentrations did not differ significantly between 2016 and 2017 deer tissue samples (P=0.369).

Mercury

Mercury occurs naturally and enters soil, water and air by the weathering of minerals in rocks and soils (Agency for Toxic Substances and Disease Registry 2017). Mercury is also introduced into the environment from anthropogenic usage, including: the pulp and paper manufacture, combustion of coal, and disposal of medical and electrical equipment (Agency for Toxic Substances and Disease Registry 2017; United States Department of the Interior 2016; CCME 2017).

Mercury has a LDL of 0.0010 mg/kg ww. Four samples had non-detectable concentrations (i.e., <0.001 mg/kg ww) and the rest of the samples had concentrations ranging from 0.0014 mg/kg ww to 0.0114 mg/kg ww. The highest concentrations of mercury were detected in D004 and D017, with concentrations of 0.0114 mg/kg ww and 0.0109 mg/kg ww, respectively.

Results of the Kruskal-Wallis test indicate that mercury concentrations were significantly lower in the 2017 tissue samples compared with the 2016 baseline concentrations (P=0.000).

Molybdenum

Molybdenum occurs naturally in rocks, and the weathering of igneous and sedimentary rocks (especially shales) introduces molybdenum to the environment naturally. Molybdenum can also be released into the environment by combustion of fossil fuels and through waste products of industries using molybdenum (CCME 2017).

All of the samples in this study had detectable levels of molybdenum (LDL of 0.0040 mg/kg ww); with concentrations ranging from 0.0104 mg/kg ww to 0.866 mg/kg ww. Four samples contained molybdenum concentrations exceeding 0.8 mg/kg ww. D023, D024, D034, and D035 had molybdenum concentrations measuring 0.825 mg/kg ww, 0.81 mg/kg ww, 0.845 mg/kg ww, and 0.866 mg/kg ww, respectively.

Results of the Kruskal-Wallis test indicate that molybdenum concentrations did not differ significantly between 2016 and 2017 deer tissue samples (P=0.556).

Nickel

Nickel is mined commercially in Canada including in Ontario. Nickel is found naturally in soils and water through the weathering of bedrock and can accumulate in plants. Human activities such as such as burning fossil fuels can also cause nickel to be introduced into the environment, as well

as waste from nickel industries such as electroplating, stainless steel and alloy production (Agency for Toxic Substances and Disease Registry 2017; United States Department of the Interior 2016).

Most (86.1%) of the tissue samples had nickel concentrations below the LDL of 0.040 mg/kg ww. The remainder of the samples had nickel concentrations ranging from 0.045 mg/kg ww to 0.076 mg/kg ww. Of the 36 samples, only D026 (0.076 mg/kg ww) was within the top 25% of the nickel concentrations measured.

Results of the Kruskal-Wallis test indicate that nickel concentrations were significantly lower in the 2017 tissue samples compared with the 2016 baseline concentrations (P=0.040).

Phosphorus

Phosphorus can be released into soil and water by natural weathering process of native bedrock, and is actively taken up by plants. Decomposition of these plants is another source of phosphorus to the environment, as well as such anthropogenic sources as fertilizers, pesticides and detergents (Lenntech 2017).

Phosphorus has a LDL of 2.0 mg/kg ww. All of the tissue samples had detectable levels of phosphorus ranging from 671 mg/kg ww to 4530 mg/kg ww. The minimum concentration of 671 mg/kg ww (D019) is substantially lower than the next lowest concentration of 1580 mg/kg ww.

Results of the Kruskal-Wallis test indicate that phosphorus concentrations did not differ significantly between 2016 and 2017 deer tissue samples (P=0.754).

Potassium

Potassium is found in nature as a mineral and is released into the environment by natural weathering processes although it is resistant to weather processes. Potassium is used widely in fertilizers and detergents which can also introduce this element into the environment (Lenntech 2017). Potassium is needed for all life and is found in all plants and animals. This element is readily accumulated (CCREM nd).

All of the deer tissue samples had detectable levels of potassium (LDL of 4.0 mg/kg ww), ranging from 2150 mg/kg ww to 4190 mg/kg ww. The potassium concentrations differed little between the samples and no elevated concentrations were detected.

Results of the Kruskal-Wallis test indicate that potassium concentrations did not differ significantly between 2016 and 2017 deer tissue samples (P=0.060).

Rubidium

Rubidium exists naturally in minerals and rocks and enters soil and water by natural weathering processes. Rubidium can also be introduced into the environment due to human activities, such as glass dust, however natural sources are considered more abundant (Salminen et al. 2005).

The LDL of rubidium is 0.010 mg/kg ww. All of the samples had detectable levels of rubidium ranging from 6.59 mg/kg ww to 37.5 mg/kg ww. The highest concentrations of rubidium were detected in D013, D019, D016, and D033, with concentrations measuring 25.4 mg/kg ww, 26 mg/kg ww, 24 mg/kg ww, and 37.5 mg/kg ww, respectively.

Results of the Kruskal-Wallis test indicate that rubidium concentrations were significantly lower in the 2017 tissue samples compared with the 2016 baseline concentrations (P=0.017).

Selenium

Selenium occurs naturally in rocks and soils, is easily taken up by plants, and can be introduced to the water and air by natural weathering processes and volcanic activity (CCREM nd). Selenium can also be released into the environment by the burning of coal and oil (Agency for Toxic Substances and Disease Registry 2017).

Selenium (LDL of 0.010 mg/kg ww) was detected in all of the samples, with concentrations ranging from 0.135 mg/kg ww to 1.85 mg/kg ww. The highest concentrations of selenium were detected in D007, D010, and D017 (1.85 mg/kg ww, 1.06 mg/kg ww, and 1.12 mg/kg ww, respectively).

Results of the Kruskal-Wallis test indicate that selenium concentrations did not differ significantly between 2016 and 2017 deer tissue samples (P=0.000).

Sodium

Sodium exists naturally exists in the earth's crust, including as sodium chloride (salt) deposits. It is released into soils and waterbodies by weathering and leaching. Anthropogenic products and use in snow and ice control (sodium chloride) can also introduce sodium into the environment (United States Department of the Interior 2016; CCREM nd).

Sodium has a LDL of 4.0 mg/kg ww. All of the samples had detectable levels of sodium which ranged from 352 mg/kg ww to 1,510 mg/kg ww. The highest sodium concentrations were measured in D009, D021, D022, and D027, with sodium levels of 1,200 mg/kg ww, 1,510 mg, kg ww, 1,230 mg/kg ww, and 1,260 mg/kg ww.

Results of the Kruskal-Wallis test indicate that sodium concentrations were significantly higher in the 2017 tissue samples compared with the 2016 baseline concentration (P=0.048).

Strontium

Strontium is found in nature through the weathering of native rocks, and can accumulate in many plants. Strontium can be introduced into the environment by burning coal and oil (Agency for Toxic Substances and Disease Registry 2017).

Strontium has a LDL of 0.010 mg/kg ww. All samples had detectable levels of strontium, with concentrations ranging from 0.011 mg/kg ww to 0.317 mg/kg ww. The maximum value (0.317 mg/kg ww) was substantially higher than the rest of the sample values.

Results of the Kruskal-Wallis test indicate that strontium concentrations did not differ significantly between 2016 and 2017 deer tissue samples (P=0.012).

Tellurium

Tellurium exist naturally in coal and minerals though is quite rare (Lenntech 2017). Natural weathering processes introduce tellurium into soils (Salminen et al. 2005) from where it is taken up readily by plants (Lenntech 2017). Tellurium can be introduced into the environment as a by-product of copper and lead refining (P S Analytical 2015).

Tellurium has a LDL of 0.0040 mg/kg ww and all of the samples in this study were below this concentration level.

Results of the Kruskal-Wallis test indicate that tellurium concentrations did not differ significantly between 2016 and 2017 deer tissue samples (P=1.000).

Thallium

Thallium has a LDL of 0.00040 mg/kg ww. Over half (55.5%) of the samples had non-detectable thallium concentration levels. Concentration levels measured in the rest of the samples ranged from 0.00042 mg/kg ww to 0.00172 mg/kg ww. The maximum concentration of 0.00172 mg/kg ww (D030) is substantially higher than the rest of the sample concentrations.

Results of the Kruskall-Wallis test indicate that thallium concentrations did not differ significantly between 2016 and 2017 deer tissue samples (P=0.117).

Thallium is found naturally in soils, air and water as a result of weathering of native rocks, and is readily taken up by plants (Agency for Toxic Substances and Disease Registry 2017).

Tin

Tin also is found naturally in soil, air and water, and can be released to the environment from industrial discharges, steel manufacturing and municipal sewage as well as other anthropogenic sources (CCREM nd).

Tin has a LDL of 0.020 mg/kg ww. Seventy-two percent (72.2%) of the samples had non-detectable tin concentration levels. The concentrations of the remaining samples ranged from 0.022 mg/kg ww to 0.075 mg/kg ww. Two samples (D026 and D030) contributed to the top 25th percentile of the sample set, with concentrations of 0.05 mg/kg ww, and 0.075 mg/kg ww, respectively.

Results of the Kruskal-Wallis test indicate that tin concentrations were significantly lower in the 2017 tissue samples compared with the 2016 baseline concentrations (P=0.005).

Uranium

Uranium naturally occurs in rocks and can be readily mobilized by weathering and natural erosion (CCME 2017).

Uranium accumulates in plants, especially in the roots Uranium has a LDL of 0.00040 mg/kg ww. Four samples (11.1%) had detectable uranium concentration levels ranging from 0.00060 mg/kg ww to 0.00457 mg/kg ww. Only one sample (D026) contributed to the top 25th percentile of uranium concentrations, with 0.00457 mg/kg ww of uranium detected.

Results of the Kruskal-Wallis test indicate that uranium concentrations did not differ significantly between 2016 and 2017 deer tissue samples (P=0.326).

Vanadium

Vanadium is naturally occurring element present in the earth's crust in abundance, particularly with basic igneous rocks. It is released to soils, water and air by weathering processes. Anthropogenic sources of vanadium include air borne particles from oil and coal combustion, and steel production (CCREM nd).

Vanadium has a LDL of 0.020 mg/kg ww. Fifty-eight percent (58.3%) of the samples had non-detectable vanadium concentration levels and the rest ranged from 0.022 mg/kg ww to 0.236 mg/kg ww. Notably, the two highest concentration levels (0.202 mg/kg ww and 0.236 mg/kg ww) are substantially higher than the next highest concentration level (0.113 mg/kg ww).

Results of the Kruskal-Wallis test indicate that vanadium concentrations did not differ significantly between 2016 and 2017 deer tissue samples (P=0.218).

Zinc

Zinc is a common element in the earth's crust. It is mined and refined in Canada and has many of industrial uses. Anthropogenic sources of zinc release to the environment include burning of coal, fertilizer use and steel production (Agency for Toxic Substances and Disease Registry 2017). Zinc is an essential element, and is easily taken up by plants.

All of the deer tissue samples had detectable levels of zinc ranging from 6.22 mg/kg ww to 50.4 mg/kg ww. Zinc concentrations were notably lower in D019 and D031 than the rest of the samples (6.22 mg/kg ww and 11 mg/kg ww, respectively). The remaining concentrations were relatively similar between the samples.

Results of the Kruskal-Wallis test indicate that zinc concentrations did not differ significantly between 2016 and 2017 deer tissue samples (P=0.918).

Zirconium

Zirconium is present naturally in minerals and rocks, although the most common form is resistant to weathering so it is not often introduced into soils and therefore not often taken up by plants (Lenntech 2017). Zirconium can also be introduced into the environment due to human activities; however, natural sources are considered more abundant (Salminen et al. 2005).

Zirconium has an LDL of 0.040 mg/kg ww. Only two samples (5.6%), D031 and D030, had detectable concentration levels (0.053 mg/kg ww and 0.055 mg/kg ww, respectively).

Results of the Kruskal-Wallis test indicate that zirconium concentrations did not differ significantly between 2016 and 2017 deer tissue samples (P=0.143).

Cyanide

Cyanide is group of organic compounds that can be found naturally in the environment or introduced through anthropogenic means. Some micro-organisms (bacteria, fungi and algae) produce cyanide and it is also found naturally in some plants such as soy and released to the environment during decomposition. Cyanide can also be introduced into the environment from industrial processes and effluent, including from gold processing plants; as well as from landfills, public wastewater treatment plants, and some pesticides (Agency for Toxic Substances and Disease Registry 2017; United States Department of the Interior 2016).

Cyanide has a LDL of 0.10 mg/kg ww and in 2017 only one sample (3.3%) had a detectable concentration level of 0.11 mg/kg ww. This value is considered low as it is very close to the LDL.

Results of the Kruskal-Wallis test indicate that cyanide concentrations were significantly lower in the 2017 tissue samples compared with the 2016 baseline concentrations (P=0.000).

Comparison of Results to Distance of Harvest from the Project Boundary

The concentration of contaminants relative to the distance between the deer tissue harvest location (shown in Figure 2-1) and the boundary of the RRM are presented in Table 3-3 and Figure 3-1. These data are presented to illustrate early patterns between potential contaminant concentration levels in deer tissue and proximity to the RRM. Interestingly, the number of analytes that showed decreasing concentrations with increasing distance from the RRM was the same as

the number of analytes that showed increasing concentrations with increasing distance from the RRM. However, as seen in Table 3-3 and in the various graphs in Figure 3-1, none of the contaminants exhibited a strong relationship between concentration levels and proximity to the RRM boundary. No test for significance was performed on the r_s values since all of the relationships between analyte and distance from the RRM were interpreted as very weak or weak.

Within most of the potential contaminant concentration datasets there exists a high degree of variability. The standard deviations calculated for the potential contaminants sampled in 2017 ranged from 0.00 mg/kg ww to 737 mg/kg ww. The low sample size (n=36) is a likely contributor to the high degree of variation detected in the datasets. With subsequently sampling rounds, it is anticipated that between year data can be pooled for each of the potential contaminants, resulting in a more robust dataset from which to observe statistical trends.

Table 3-1: Measured Contaminants in White-tailed Deer Samples in 2017 (n=36)

Contaminant	Mean	Median	Minimum	Maximum	SE[1]	SD[2]	Kurtosis[3]	Skewness[3]
	(mg/kg ww)	(mg/kg ww)	(mg/kg ww)	(mg/kg ww)	(mg/kg ww)	(mg/kg ww)

4.0 DISCUSSION

Wildlife exposure to contaminants such as metals may come from ingestion of effected plants, soil or water that have been exposed to the contaminants. Metal contaminants arise from many sources, including some which occur naturally in the environment, but may also be formed from industry discharges (Oladunjoye et al. 2015). Some of these metals occur naturally in the environment and are required by wildlife in small (trace) amounts for nutrition. While these metals may become toxic at high concentrations, deficiencies in some of these metals can also cause health problems.

There are few published studies on contaminant concentrations in the tissues and organs of deer in Ontario and Canada, and little is known about the normal nutritional requirements of various minerals and elements by deer (Schultz et al. 1994, Khan et al. 1995, Zimmerman et al. 2008). Accordingly, little is known about what the normal baseline concentrations are in deer for the various metals analyzed in this study. Similarly, information is not available regarding what concentrations would be considered detrimental, nor what the effects of detrimental concentrations would be on the physiology of deer.

Direct comparisons between the data collected in this study (including the baseline data) and previous studies are difficult for many reasons, such as differences in variables such as age, sex, habitat, food sources and proximity to anthropogenic sources of contamination, which are all often unknown. Therefore, the baseline data collected in 2016 is assumed to represent the normal variation in the concentration levels of the elements examined in this study for local White-tailed Deer populations. The 2016 results will therefore provide pre-operation data for comparison with 2017 post-operation concentration levels and future study results from data collected as the RRM continues operations. The purpose of these comparisons is to identify any exposure and ecological risk to local wildlife from mine-related contaminants and asses the risks to humans that consume local wildlife should they arise.

Both, the 2016 baseline data and the 2017 data had high variations in the concentrations measured in the tissue samples for several contaminants. Such a high variation in values renders interpretation problematic with only one year of comparison. Two of the donors in the 2017 sample collection (D026 and D030) contained maximum concentration levels for five and six of the parameters, respectively. Most donors contained only one maximum concentration, suggesting something other than the impact of mining activities were causing the elevated contaminant levels in these two individuals. It is possible that their health was otherwise compromised, but the results of this study are unable to confirm this hypothesis. A similar trend was observed in the 2016 dataset, where one donor was discovered to have several elevated contaminant concentrations. The liver of this individual was discoloured, suggesting compromised health. Trends in data will be more obvious as subsequent sampling takes place and more data is available for statistical comparisons.

6.0 CLOSING

This White-tailed Deer Tissue Sampling Report was prepared by Wood for the sole benefit of New Gold Inc. RRM for specific application to the RRM site. The quality of information, conclusions and estimates contained herein are consistent with the level of effort involved in Wood's services and based on: i) information available at the time of preparation, and ii) the assumptions, conditions and qualifications set forth in this document. This report is intended to be used by New Gold Inc. only, and its nominated representatives, subject to the terms and conditions of its contract with Wood. Any other use of, or reliance on, this report by any third party is at that party's sole risk. This report has been prepared in accordance with generally accepted industry-standard. No other warranty, expressed or implied, is made.

If you require further information regarding the above or the project in general, please contact Dan Russell, Geoscientist, Mining Environmental or Matt Evans, Senior Ecologist, Environmental at (905) 568-2929. Thank you for the opportunity to be of service to New Gold Inc.

1.0 INTRODUCTION

The Rainy River Mine (RRM) is located in the Rainy River District, in northwestern Ontario in Chapple Township, approximately 65 kilometers (km) northwest of Fort Frances and 420 km west of Thunder Bay. The mine includes an open pit mine, a mill, tailings management area (TMA), process water and water treatment structures. The project is currently in its second year of construction and close to operations in late 2017 at the time of this Operation, Maintenance and Surveillance (OMS) manual update (to August 15, 2017).

This OMS Manual has been prepared by the Rainy River Mine with the assistance of AMEC Foster Wheeler (AMECFW) and the Engineer of Record for the dams. The OMS is a requirement of the Ministry of Natural Resources and Forestry (MNRF), Lakes Rivers Improvement Act (LRIA) approvals, and has been prepared in general accordance with the latest guidelines titled "Developing an Operation, Maintenance and Surveillance Manual for Tailings and Water Management Facilities:" developed by the Mining Association of Canada (MAC, 2011).

The goal of the OMS Manual is to provide specific guidance the operation to the Tailings, Water Management and Water Diversion dams. The objectives of this OMS are to define and describe the following:

- Roles and responsibilities of personnel assigned to the facility;
- The key components of the facility;
- Set out procedures required to operate, monitor the performance of, and maintain a facility to ensure that it functions in accordance to design, meets regulatory and corporate policy obligations, and links to emergency preparedness and response;
- Procedures and processes for managing change;
- Requirements for analysis and documentation of the performance of the facility;
- Serve as a training document for personnel that are new to the mine;
- Identify potentially unsafe conditions or indicators and provide links to emergency response procedures; and
- Satisfy the requirements of the Mining Association of Canada's (MAC) guidelines Towards Sustainable Mining (TSM) initiative.

The OMS Manual covers operations of the facility through the commissioning, operations, and closure phases of the Rainy River Mine. The tailings facilities include the equipment and operations beginning with the tailings discharge from the mine mill, pipelines, deposition equipment, tailings, water treatment and water management (seepage collection ponds) and water diversion. In addition, the OMS guides operators and staff on when to initiate the EPRP.

This document has been prepared primarily for use by the mine personnel who are responsible for the operation, maintenance and surveillance of the tailings facility. It contains information and instructions necessary to perform the above required activities. Comprehensive checklists and procedures for operation, maintenance and annual inspections are utilized by the RRM e.g., through the SAP work order system and are not reproduced herein.

1.1 Regulatory Requirements and Guidelines

This document is consistent with the New Gold Tailings, Heap Leach and Waste Rock Facilities Management Policy and was prepared pursuant to the MAC guidelines for *Developing an Operation, Maintenance and Surveillance Manual for Tailings and Water Management Facilities* (MAC, 2011).

There are a number of Federal and Provincial environmental approvals required to construct, operate, and eventually reclaim the mine. Key Provincial legislation related to the RRM includes the: *Ontario Water Resources Act*, *Environmental Protection Act*, *Endangered Species Act*, *Mining Act*, *Lakes and Rivers Improvement Act*, *Public Lands Act* and *Planning Act*. From the Federal perspective, the *Fisheries Act* and the associated Metal Mining Effluent Regulation are the primary regulatory instruments related to the RRM.

The primary approval(s) for construction of the various hydraulic structures and associated water storage facilities are as follows:

- Work Permits from Ontario Ministry of Natural Resources and Forestry (MNRF), under the *Lakes and Rivers Improvement Act* (LRIA).
    - These permits approve the design of the dams and appurtenances, in accordance with the provided design drawings and report.
    - LRIA approvals are generally required for each annual dam raising campaign.
- Discharge of effluent (e.g. from the TMA) is governed by the Environmental Compliance Approvals (ECAs) for Industrial Sewage Works issued under the *Environmental Protection Act* by the Ontario Ministry of the Environment and Climate Change (MOECC).
    - The ECAs dictate the quality and quantity of effluent allowed to be discharged to the environment as well as other measures intended to ensure the environment is protected; as well as the overall design of the facility.
- Permits to Take Water (PTTWs) issued under the *Ontario Water Resources Act* direct water takings associated with the Site, including dam foundation dewatering and water supply from the Pinewood River.
    - Where water takings (surface or groundwater) are required to support construction and operation, they are generally restricted by the PTTWs received from the MOECC which limit the volume of water that can be taken from the environment.
- A Closure Plan has been filed with the Ministry of Northern Development and Mines (MNDM) under the *Mining Act,* which describes the planned development and operation of the RRM, the proposed approach to closure of the RRM, and outlines the associated financial assurance related to closure aspects.
    - This Closure Plan will be amended from time to time as required, such as any changes to the proposed operation of the TMA, or other changes to the RRM which are deemed to be material.
    - The Closure Plan primarily focuses on the physical and chemical stability of the site post-closure or during a temporary shutdown scenario.

- Planning to date has assumed permanent flooding of the potentially acid generating (PAG) tailings to inhibit oxidation.

In addition to these and other regulatory approval requirements, a number of commitments were made regarding the RRM through the Federal and Provincial environmental assessment processes. These commitments were initially tabulated in Table 14-1 of the Rainy River Project, Final Environmental Assessment Report (AMEC, January 2014) and are maintained and tracked by the Environmental Department as the Rainy River Project Commitments Registry.

Where pertinent to the operation of tailings and water management and water diversions, specific regulatory approvals have been included in this manual (Table 1-1). However, the full list of regulatory conditions has not been reproduced herein and should be reviewed, where required, including when changes to the OMS of the facilities are considered. The full list of regulations, permits and approvals associated with this OMS are available through the site environmental team who should be contacted for the most current environmental approval and regulatory requirements.

Table 1-1; Summary of Permits and Approvals Relating to the OMS

Legislation	Permit	OMS Component	Influence
Environmental Protection Act	Environmental Compliance Approval #0412-A2LR4V (Air)	TMA	Limits and requirements related to emissions and discharges related to air.
	Environmental Compliance Approval #5178-9TUPD9 (Industrial Sewage)	TMA, process water management and water treatment	Limits and requirements related to emissions and discharges to the environment.
Ontario Water Resources Act and O.Reg 387/04	PTTW number 8776-9W2QN3	WMP/Pinewood River	Defines water taking limits and defines reporting and monitoring requirement
	Permit to Take Water – Surface and Groundwater PTTW 0040-9VUL6B TMA Infrastructure	TMA and process water management	Defines water taking limits and defines reporting and monitoring requirement
	Permit to Take Water – Surface and Groundwater PTTW 2133-9VUPVZ Construction Phase	Fresh Water Diversions and Water Treatment	Defines water taking limits and defines reporting and monitoring requirement
Lakes Rivers Improvement Act	FF-2015-02B (as amended) West Creek Diversion and Dam	Freshwater Diversions	Management, protection, preservation and use of waters and lakes. Ensure that dams are suitably located, constructed, operated and maintained.
	FF-2015-03B Clark Creek Diversion (as amended)	Freshwater Diversions	
	FF-2015-04 Tailings Management Area	TMA, Process Water Management and Water Treatment	

Legislation	Permit	OMS Component	Influence
	FF-2015-04A (as amended March 6, 2017) Water Management 4 and 5	Process Water Management	
	FF-2015-04B (as amended March 6, 2017) Water Management Ponds1, 2 and 3	Process Water Management	
	FF-2015-04C Tailings Management Area (Start-Up Arrangement), Haul Road 13 and TMA Start-Up Cell	Tailings Management Area	
	FF-2015-05A (as amended) Mine Rock Pond	Process Water Management	
	FF-2015-07 Pinewood River Intake/Discharge Structure	Process Water/Water Treatment	Management, protection, preservation and use of waters and lakes.
	FF-2017-03 Tailings Management Area Cell 2	Tailings Management Area	Management, protection, preservation and use of waters and lakes. Ensure that dams are suitably located, constructed, operated and maintained.
Endangered Species Act	ESA Permit FF-C-001-14	All	Defines project boundaries, disturbance limits including noise and dust and reclamation
Fisheries Act	Authorization 15-HCAA-00039	Freshwater diversions	West, Clark, Teeple, Stockpile dams and diversions
	Metal Mining Effluent Regulation (MMER) discharge notification	TMA, WMP Water Treatment and seepage	Standards/limits for quality of effluent discharged into waters frequented by fish.
Ontario Environmental Assessment Act	Provincial EA Approval Conditions	All	Conditions subject to the Approval to proceed with the planning, design, construction, operation and closure of a combination open pit and underground gold mine.
Federal Canadian Environmental Assessment Act 2012	Federal EA Approval Conditions	All	Conditions in relation to the environmental effects referred to in subsection 5(1) of CEAA 2012, with which the Proponent must comply.
Environmental Assessment (EA) Act	Environmental Assessment (EA) Commitments	All	Commitments identified in the final Environmental Assessment (EA) Report, in accordance with the Federal

Legislation	Permit	OMS Component	Influence
			Environmental Impact Statement (EIS) Guidelines and Provincially approved Amended Terms of Reference (ToR).

1.2 Review and Update

The accountability for review and updates of the OMS Manual is with the Mill Manager (who will designate responsibility for the review) as well as the General Manager who has final site authority.

Updates to the OMS manual are required to incorporate change as facilities are constructed or change in facility design, performance, capacity, operations/closure requirements, site management, roles and responsibilities, regulations or procedures. When updated the OMS manual will be reviewed by the Environmental Department, Engineer of Record (EOR) and annually, as part of review by the Independent Tailings Review Board (ITRB) or as at their request.

The OMS will be updated prior to operating new structures. The OMS manual will be reviewed, at minimum, on an annual basis. The OMS manual will be submitted to MNRF as defined by permit conditions as part of annual updates.

Previous revisions and future proposed revisions are outlined in the revision history presented below (Table 1-2). Comments from the MNRF and ITRB are included in Appendix G. This revision history will be updated for each revision – **this revision is current to August 15, 2017.**

Table 1-2; OMS Revision History

Revision	Addition	Details	Date
Pre-Production OMS Manual (3098004-000000-A1-EMA-0001):			
AG	Revised Final for Pre-Production	Updated dam design criteria, instrumentation details – submitted for MNRF review and comment	August 31, 2016
AH	Revised Final for Pre-Production	Updated in response to MNRF comments – see appendix G	October 5, 2016
AI	Revised Final for Pre-Production	Removed reference to WMP filling plan	November 10, 2016
AJ	Final with West Creek Diversion updates	Required by MNRF in West Creek Diversion LRIA approval	March 31, 2017
00	For Use	WMP Filling, Clark Creek Diversion (MNRF approval April 28, 2017)	May 1, 2017
01	For Use	Updated for WMP filling above 364.7	July 2017
OMS Manual for Operations (3098004-000000-A1-EMA-0002):			

Revision	Addition	Details	Date
AC	Final draft	Including TMA Start-up Cell details submitted to MNRF	March 31, 2017
OMS Manual – Current revisions			
2017-08	Updated based on ITRB comments and MNRF conditions for MRP and Cell 2 and 3	ITRB comments (Appendix G) responses • Updated sections to current project status and current to Aug 15, 2017 • Contact list updated (s2.3) • Revised geology section re plastic clay tills (s3.3) • Included trigger levels for instrumentation and defined thresholds for event driven surveillance (Table 7.3) • States responsibility for OMS updates (s1.2 and s2.2) • Reworded reference to MNRF screening but submission for comment (s1.2) MNRF requirements consistent with LRIA permit conditions • Mine Rock Pond (s4.3.2 and s5.3.2) • Cell 2 (s4.2.2. and s5.1.2) • Cell 3 (s4.2.3 and s5.1.2)	August 2017
Future Planned Updates – excludes updates required as a result of unplanned changes			
TBD	TMA Starter Cell Completion	Update OMS prior to completion of TMA south starter dam	May 1, 2018 or as determined by LRIA conditions of approval
TBD	Water Discharge Pond and Constructed Wetland	Update OMS prior to the commissioning of theses facilities	June 30, 2018 or as determined by LRIA conditions of approval
TBD	Sediment Ponds 1 and 2	Update OMS prior to the commissioning of theses facilities	
TBD	Annual update 2018	Annual review and update e.g., include ITRB comments	August 2018

1.3 Supporting Documents

The OMS manual and supporting documents will be stored in a location accessible to those required to follow the manual i.e., RRM sharepoint site. The list of supporting documents (Table 1-3) isn't an exhaustive list and permit approvals are based on applications and supplemental information which need to be followed (see list of regulatory permits and approvals Table 1-2).

The following documents and procedures are relevant to the geotechnical site investigations, design, construction, and operation of the TMA, process water ponds, and freshwater diversion dams and channels are listed below (Table 1-3). However, additional information is provided in the facility description section of this manual (see section 4). A list of supporting drawings is provided in Appendix A. Additional details regarding pumping requirements, tailings pumping and pipeline designs and water recirculation pumping and pipeline designs are provided in Appendix B.

Safety requirements for work at the RRM and apply to work associated with the OMS are documented on the RRM health and safety sharepoint site and include;

- Hazard Identification and Risk Management;
- Document Records and Development Control;

1.4 Document and Records Control

Records from shift and periodic (daily, weekly and annual) TMA and water management system inspections will be retained in a secure repository as per the requirements of the site document control system. Once documents are printed, they are uncontrolled. Document Control follows the New Gold RRM document control procedures.

All records relating this OMS manual shall be retained for a minimum period of 25 years or until decommissioning ends, whichever is longer, as per regulatory requirements in the Federal CEAA Decision Statement. This includes place, date, time of sampling, dates and types of analysis performed, analytical techniques, methods or procedures, results of analysis and the names of persons who collected, analysed each sample and documentation of their training. All records and documents shall be retained at a facility close to the RRM.

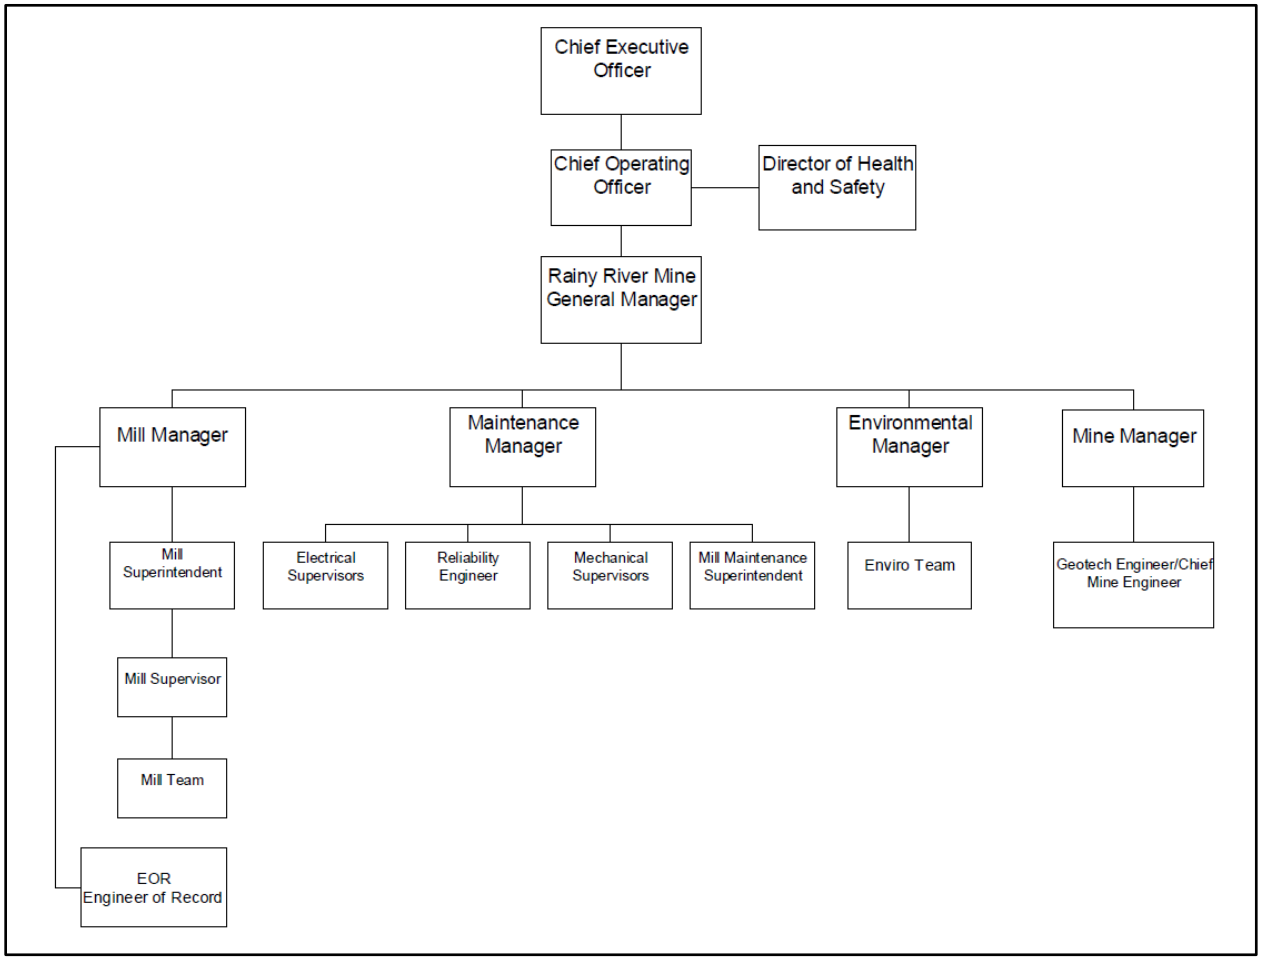
2.0 ROLES AND RESPONSIBILITIES

This section identifies the individuals having responsibility for the operation, maintenance and surveillance of the tailings, process water and freshwater dams and diversion channels. Though the accountability of tailings and water management lies with the General Manager, the Mill Manager is responsible for the operation of the tailings and water management at the RRM. The Environmental Department provides environmental technical support, including monitoring, land and water management and environmental contact with regulatory agencies.

2.1 Organizational Structure

The organizational structure for the RRM, relative to the OMS, is illustrated in Figure 2-1. The RRM/New Gold personnel and contact information associated with the positions referenced within each organizational flow chart can be found in Table 2-1. The organization chart is representative of the organization of persons related to the OMS following the construction and hand over of facilities. Prior to the handover of facilities, the EOR reports through the construction management team, for those facilities under construction.

Figure 2-1; Organisation Chart For Tailings and Water Management



2.2 Roles and Responsibilities

Executive Vice President / Chief Operating Officer:

- Is formally responsible for all of New Gold's operations; and
- Has responsibility for corporate "*Tailings, Heap-leach and Waste Rock Facilities Management Policy*". (included in Appendix C)

General Manager:

- Has accountability for tailings management;
- Shall ensure that all TMA, process water and freshwater structures meet Canadian Dam Association, Dam Safety Guidelines;

Mill Manager:

- Has responsibility for the tailings management facility and ancillary process water management structures, and water diversion structures including operation, maintenance and surveillance;

- Accountable for ensuring maintenance of the OMS Manual and conformance to the Mining Association of Canada's "Guide to Developing Operation, Maintenance and Surveillance for Tailings and Water Management Facilities";
- Ensures that manuals for the tailings and water management systems are reviewed annually, including an assessment of the effectiveness of the established system and performance against objectives, and updated as required;
- Ensures that the tailings handling and disposal operation is staffed by trained and competent persons;
- Integrates guidance from the Environment Department under the requirements of regulatory approvals and the Environmental Management System (EMS) where applicable to tailings management;
- Shall submit an annual dam safety inspection report for all dams (TMA area and others) to MOECC/MNRF where required; and
- Report any potential facility design changes that could affect the facility's integrity.
- Coordination of activities with the EOR during operations; and
- Has emergency management and response roles.

Maintenance Manager:

- Has primary responsibility for the maintenance work and maintenance management systems including dams and water management structures; and
- Ensures records of maintenance inspections for the dams and water management structures and related activities are accurately and permanently recorded and provided to the Geotechnical Engineer and the Engineer of Record (EOR).

Reliability Engineer, Mechanical Superintendent and Electrical Supervisors:

- Oversees planning and execution of equipment maintenance through the work order system;
- Arranges/conducts maintenance for equipment e.g., calibration and maintains instrumentation calibration records; and
- Identifies issues and corrective actions to prevent incidents.

Chief Mine Engineer / Geotechnical Engineer:

- Manages dam design, construction and contracts;
- Completing quarterly and annual inspections on TMA, process water and freshwater dams, diversion channels;
- Ensuring monitoring activities are undertaken as per schedule;
- Responding to concerns raised by operations personnel;
- Maintaining a dam raise schedule;
- Review spigotting and dam construction schedules;
- Construction oversight for major dam raise projects;

- Ensure that the OMS Manual is updated appropriately, as assigned by the Mill Manager; and
- Coordinating and managing survey.

Mill Superintendent:

- Responsible for ensuring daily, monthly and as-required reports with respect to all aspects of the operation, maintenance and surveillance of the tailings facilities are prepared, including all records of inspection and monitoring;
- Ensures that a system exists to implement the OMS manual procedures and requirements and the system is subjected to regular review and effectiveness checks;
- Oversees water taking from the Pinewood River;
- Participates in the review cycle for the OMS manual; and
- Undertakes any modifications as required to maintain a safe and effective tailings operation including adjustments to deposition plans, equipment and facilities.

Mill Supervisor:

- Responsible for the day-to-day operation, maintenance and surveillance of the tailings distribution system and related works including buildings, equipment, pipes, pumps, and dams;
- Verifies work order completion;
- Identifies new and revised maintenance requirements; and
- Performs visual inspection surveillance of tailings facilities including dams, pipelines, decants and other operations.

Mill Team:

- Responsible for operating, inspecting and maintaining dams and water pump houses;
- Responsible for security inspections during the shift, via work requests;
- Perform inspections, monitoring, audits and assessments including but not limited to;
    - Visual inspection (dams, water, spillways and pipelines);
    - Water levels;
    - Freeboard; and
    - Instrumentation.
- Ensures adequate maintenance, via work requests, of access roads, diversion ditches, emergency spill catchment areas and the reclaim water system; and
- Adjusting spigotting as directed by the supervisor.

Engineer of Record (EOR):

- Verifies the TMA and water diversion structures are constructed and operated as per the design intent;
- Performs Annual Dam Safety Inspections as per regulatory requirements; and

- Provides support for safe operation of the TMA and water diversion structures.

Environmental Manager:

- Support the Operation, Maintenance and Surveillance activities;
- Maintain contact and communication with regulatory agencies;
- Assist with environment related technical support such as inspection and evaluation of stability by an external expert;
- Ensure regulatory and other sampling, monitoring, and analyses programs are conducted as required and all analytical results and/or reports are reviewed and reported to the appropriate internal and external stakeholders;
- Ensure rehabilitation and stabilization programs are conducted for tailings in conjunction with closure plan requirements;
- Prepare Annual Reports to regulatory agencies; and
- Administer and track compliance against Permits.

Environmental Team:

- Monitor conformance with relevant permits for the OMS manual requirements;
- Perform inspections, monitoring, audits and assessments including but not limited to;
    - Visual inspection (dams, water, spillways and pipelines); and
    - Instrumentation.
- Integrate tailings operations activities into the EMS;
- Identify and assess applicable tailings related regulatory requirements including permits, licenses, authorizations;
- Support tailings/geotechnical engineering and operations efforts; and
- Provides environmental support to the mill area activities and parties including but not limited to: construction, earth moving, erosion and dust control and water discharges.
-

2.3 Contact Information

The RRM contact information, for the positions listed in Sections 2.1 and 2.2, can be found in Table 2-1.

2.4 Competency and Training

Training and education will be provided to employees to enhance their performance and RRM will ensure that all personnel receive the level of training to ensure they are competent. Tailings specific training is essential in ensuring safe and effective operation of the TMA as well as correct construction. The RRM in conjunction with the Engineer of Record will provide training programs or opportunities as required and job related training covering aspects related to requirements for the specific types of equipment and operational requirements.

Table 2-1 demonstrates the training that will be provided at a minimum, to support operation of the tailings water, process water, water treatment and freshwater management structures as required.

3.0 SITE CONDITIONS

3.1 Site Location and Tenure

The site is located in the Township of Chapple, approximately 65 kilometers (km) by road northwest of Fort Frances, in northwestern Ontario. New Gold has 100% interest in the lands forming the RRM through direct ownership or option agreement, however surface rights are not owned throughout the site boundary.

The RRM is located with lands used by Indigenous Groups for traditional and ceremonial purposes including but not limited to the following groups; Rainy River First Nations, Naicatchewenin First Nation, Big Grassy River First Nation, Naotkamegwanning (Whitefish Bay) First Nation, Anishinaabeg of Naongashiing (Big Island) First Nation, Ojibways of Onigaming First Nation, and the Sunset Country Métis community (represented by Métis Nation of Ontario Region 1 Consultation Committee). New Gold has regulatory requirements and/or biparty agreements to engage with these communities.

Road access to the site is by provincial Highways 600 and 71 and Korpi Road (east access road). A site location map is provided in Figure 3-1. The mine is serviced by local municipal infrastructure and is in close proximity to Fort Frances, Ontario for support and supply.

The site topography is variable with elevations ranging from 350 m to 390 m. The terrain is comprised of both forested and non-forested areas, including agricultural and wetland areas. The local drainage systems are characterized by numerous small creeks that drain into the Pinewood River. The small creeks typically originate from rocky uplands or headwater wetland systems.

The forested areas are dominated by mixed poplar and black spruce forests. Wetlands are comprised mainly of treed and open fens, together with wetland thickets and marsh areas.

RAINY RIVER PROJECT

Site Plan
General Arrangment

PROJECT Nº: TC150321

FIGURE: 3-1

SCALE: 1:45,000

DATE: April 2017

3.2 Climate

Weather at the site is seasonal with cold winters with freezing conditions from November until March. The site receives ~700 mm of precipitation in an average year and the pond evaporation is estimated to be ~540 mm (Table 3-1). An estimated evapotranspiration of 500 mm is inferred by the difference between precipitation and runoff in the Pinewood River.

Table 3-1; Mean Annual and 1:20 year Precipitation and Evaporation

% Difference	42.3	77.5	-61.1	-28.1	-49.6	-14.6	-67.5	-38.1	* = Data to Aug 11				

Site runoff varies widely in response to the climatic conditions. In normal (50% non-exceedance) and wetter years there is surplus water available for taking for site catchments or the Pinewood River. However, the Pinewood River frequently has no flow in September, and in extreme dry years, presents a water supply risk to the project.

Further details regarding the climatic conditions and hydrology can be found in the Water Management Plan for Operations (RRP-GEO-REP-026 R1). The site and project climatic characteristics (and seismic hazard analysis) are summarized in Table 3-2.

3.3 Surficial and Bedrock Geology

The RRM is positioned within the Achaean age Rainy River Greenstone Belt that forms part of the 900 km long, east-west trending Wabigoon Subprovince of the Canadian Shield. In general, the Rainy River Greenstone Belt is bounded by the Sabaskong Batholith in the north and the Rainy Lake Batholithic Complex in the east. It extends south into Minnesota where the Long Point Intrusive Rocks, the Baudette Intrusive Rocks (both granitoid), and the Rainy Lake – Seine River Fault, the Vermillion Fault and the Four Towns Fault constrain the belt.

The site is characterized by gently undulating topography, strongly influenced by a sequence of glaciations, which on higher ground has left bedrock exposed with little to no overburden cover. In the lower lying areas, thick overburden deposits primarily of glacial origin (e.g., till) are found.

The mine site area can be divided into two general physiographic types based on topography and frequency of bedrock outcrops. The north and east portions of the project site have numerous bedrock outcrops, with variable soil cover, where the bedrock has a significant influence on the surface topography. The southwest and central portions of the site have thicker and more extensive soil deposits, with isolated bedrock outcrops.

The surficial geology generally consists of the following stratigraphy:

- Peat/Holocene: variable thickness ranging from thin veneers to greater than 3 m in thickness;
- Glaciolacustrine clay: typically located below the peat layer (Brenna Formation) and above the Whiteshell Till (Whylie Formation). The upper unit is typically low to high plastic silty clay, with occasional sand layers. The lower unit is typically clay silt and fine sand. Both units have varved silt and clay with varying thickness typically in the millimeter scale;
- Whitemouth Lake (WML) Till: Thickest and most widespread unit on site. The till is typically medium to high plastic silty clay with trace to some sand and gravel;
- Whiteshell Till: confined under the Whitemouth Till, the Whiteshell Till is a silty sand till with some gravel and cobbles and trace clay with some boulders. It is an aquifer with artesian pressures (above the ground surface) in some locations; and
- Bedrock: underlying the Whiteshell Till.

Groundwater recharge to the deeper groundwater system (shallow bedrock and Whiteshell Till) is limited to areas where the bedrock is at surface or has limited cover of overburden, mainly to the north and east of the open pit. Very limited recharge to the deeper groundwater system is probable through the Whitemouth Lake Till on higher ground. Where glaciolacustrine clays and peat are present, recharge to the deeper groundwater system is minimal.

Note; the TMA dams have been designed assuming high pore pressures and residual strength in the clayey foundation units (Upper/Lower Glaciolacustrine and WML Till). Further details regarding the surficial geology at the site and design criteria for the TMA Dams is provided in TMA – Volume 1 – Dam Design Implications (Amec Foster Wheeler, 2016f) and Volume 2 – Investigation and Interpretations (Amec Foster Wheeler, 2016g).

3.4 Geochemistry

3.4.1 Mine Rock

Static and kinetic geochemical testing representing all major lithology types of non-ore mine rock in the vicinity of the proposed pit development determined that approximately 50% of the mine rock samples were unlikely to generate acidic drainage (NPAG) in the future (neutralization potential ratio [NPR] >2). The remainder of the samples were classified as potentially acid generating (PAG) materials with NPR<2. It's noted that NPR ratios are influences by the low concentrations of both sulphides and carbonates.

Progressive encapsulation of the PAG rock during operations and at closure will limit precipitation infiltration and flushing of oxidation products from the mine rock. Restriction of oxygen inflow to the PAG rock may occur as a result of complete encapsulation of the pile.

The dam design includes only non-potentially acid generating (NPAG) mine rock downstream of the dam core. PAG rock is used in the completion of portions the TMA starter cell/cell 1, cell 2 dam and the upstream sections of the ultimate TMA dams.

3.4.2 Tailings

Based on geochemical testing, the tailings are PAG with an expected lag time to net acidic conditions of approximately 30 years. In addition, there is a potential risk of elevated cadmium concentrations in the TMA during operations due to leaching from the tailings.

Metal release from subaerial (beached) tailings may occur prior to acidic conditions and management of the tailings pond water may be required at this time. Metal release may occur from submerged tailings; however, subaerial tailings appear to be a greater source of loadings than submerged tailings. The milled ore is also a substantial source of loadings to the tailings pond, in some cases (e.g., cadmium) it is the dominant loading source early in mining operations.

Geochemical assessments suggest that Cd concentrations in the TMA may exceed the working site specific value (0.001 mg/L subject to confirmation through permitting) within 1 year after mining begins. Reductions in the tailings beach areas could extend the period of time until exceedance is reached. Water treatment in the WMP is planned to be employed to support discharges from the WMP meeting discharge effluent quality targets.

3.5 Hydrology and Water Flow

The collection of runoff and hydrology data for the RRM is challenged by low gradient, small systems and frequent beaver impoundment. Water Survey of Canada Station 05PC011 at the Pinewood River provides the longest and most reliable available data set. Water Survey of Canada Station 05PC023 (at Highway 617) provides a shorter period of record and is known to provide erroneous readings of up to 20 %. Table 3-3 presents mean streamflow data in the Pinewood River as presented in the EA application, which have been pro-rated where required and in winter months.

Table 3-3; Monthly Streamflow in the Pinewood River at WSC 05PC011

	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec	Annual
Mean	0.218	0.144	0.538	9.595	7.135	5.412	3.163	1.536	1.787	2.352	1.913	0.383	194.8
5th %ile	0.073	0.049	0.181	3.228	2.400	1.820	1.064	0.517	0.601	0.791	0.644	0.129	65.5
95 %ile	0.440	0.292	1.087	19.41	14.43	10.95	6.398	3.107	3.615	4.758	3.870	0.776	394.1

The RRM site on the north side of the Pinewood River is drained by four small creek systems, which from east to west are: Clark Creek (Teeple Drain), West Creek, Marr Creek and Loslo Creek (Cowser Drain). These creek basins range in size from 7.3 km2 (Marr Creek) to 16.35 km2 (West Creek). Major portions of the Clark Creek, Marr Creek and Loslo Creek basins will be overprinted by RRM developments, principally the tailings management area and stockpiles. West Creek currently flows through the proposed open pit and will have to be diverted around the pit in order for the RRM to proceed.

It should be also noted that the lower approximately 3.3 km reach of Loslo Creek and 2.3 km of Clark Creek leading to the outflow into the Pinewood River have been previously designated as Municipal drains under the Drainage Act (respectively, the Cowser Drain constructed in 1980 and the Teeple Drain constructed in 1994).

3.6 Water Quality

Water quality in the area of the RRM is influence by the presence of clays/silts and water quality guidelines are frequently exceeded at baseline or upstream sites. There are a number of circumstances where exceedance of the Provincial Water Quality Objectives (PWQO) and Canadian Environmental Quality Guidelines (CEQG) values are common:

- Total metal values for samples showing elevated total suspended solids (TSS), especially for very common minerals such as aluminum and iron;
- Total aluminum concentrations in areas where clay / silt soils are common, as aluminum is a common clay mineral;
- Samples collected from under the ice in low volume water systems, because the process of ice formation tends to exclude ions from the ice crystal lattice, thereby concentrating the ejected ions in the underlying water column; and
- Samples collected during summer drought conditions in low volume water systems, because of ion concentration due to evaporative processes

The majority of parameters for surface waters met PWQO and CEQG for the protection of aquatic life, with the exception of common exceedances for aluminum (mainly CEQG), iron and phosphorus; frequent exceedances for cadmium (CEQG), copper (mainly CEQG) and cobalt (PWQO); and occasional, to rare, exceedances for arsenic, lead, nickel and zinc.

3.7 Hydrogeology

Regional groundwater flow is generally towards the west in the Pinewood River watershed, but locally is towards the Pinewood River corridor. Horizontal gradients are relatively steep on higher ground, approaching 0.01, but become more subdued in the lower lying areas where they decrease to approximately 0.003. This change in horizontal gradient is a strong indication that,

as the groundwater flows from the higher ground to lower elevations, there is flow from the relatively impermeable shallow bedrock to the more permeable Whiteshell Till and other granular material immediately above the bedrock, referred to generically as the Pleistocene lower granular deposits (PLGD).

Groundwater in the shallow bedrock and PLGD becomes confined as it moves westwards and towards the Pinewood River beneath the lower permeability silty clays of the Whitemouth Lake Till and the glaciolacustrine deposits that largely sandwich this till (the Pleistocene Aquitard). Artesian conditions within the shallow bedrock and PLGD are common along the stream corridors with upwards gradients on the order of 0.03 to 0.1, while downwards gradients occur in the higher areas between the streams.

Groundwater quality is typical calcium magnesium-bicarbonate type water with the majority of sampling points having total dissolved solids exceeding 500 mg/L. Sampling of groundwater since 2007 has indicated metal concentrations above application guidelines e.g., arsenic, cobalt, iron, molybdenum, zinc, mercury and uranium.

3.8 Biological

3.8.1 Fisheries

The fish community proximal to the RRM is dominated by baitfish and forage fish species with sportfish (e.g., Walleye and Northern Pike) in the lower Pinewood River below the Pinewood Pumphouse. Presently Marr and Loslo Creek are fish bearing and a fish relocation porgram is underway. West Creek and Clark Creek are former tributaries to the Pinewood River and have been offset for by the Clark Creek Diversion and West Creek Diversion. Clark Creek Diversion and West Creek Diversion are offsetting habitat and support all life history stages of baitfish and forage fish species.

The freshwater diversions are fish bearing waters and subject to protection under numerous permits and legislation e.g., *Fisheries Act*. Cowser Drain (Loslo Creek) and the Pinewood River are also fish bearing. Water quality discharges into these areas must meet MMER and ECA permit requirements. Additional studies as required by the ECA e.g., for mercury, sulphate and ammonia are ongoing, the results of which may influence operation of the TMA.

3.8.2 Vegetation

The RRM is within Ecoregion 5S (Agassiz Clay Plain) and there are no published Significant Wildlife Habitat Ecoregion Criteria Schedules for this ecoregion. Apsen-Birch hardwood forest is the dominant (46.6 %) forest type proximal to the mine, followed by coniferous swamp / wetland (29.4 %). Agricultural lands are present across 8 % of the area proximal to the mine, primarily along roads and in areas of well drained clays. No records of rare vegetation communities or rare plants were identified during the Environmental Assessment.

Based on the ecoregion, the growing season length is 180-190 days with mean annual temperatures of 1.5 to 3.0 ºC. The frost free period is ~125 days from mid-May to mid/late September (Ministry of Agriculture; 1976-2005).

3.8.3 Wildlife

Key wildlife aspects influencing the OMS manual include the presence of;

- Species at risk including but not limited to Eastern Whip-poor-will and bobolink which require consideration of limits of disturbance, timing of works, noise mitigation and dust management;

- Snapping turtles, for which measures must be taken to prevent them entering the TMA, process water and water treatment facilities;
- Migratory birds requiring noise mitigation measures, reduced light pollution, timing windows on clearing, deterrents to prevent use of the TMA and monitoring for use of the TMA;
- Deer, which along with other wildlife require that a fence is to be constructed around the active tailings deposition areas; and
- Bear, which along with other wildlife need to be managed through controlling wildlife-human interactions including reporting, no harassing of wildlife, no fishing or hunting on the mine site, speed restriction and waste management to exclude wildlife.

3.9 Natural Hazards

Natural hazards to the RRM are limited to weather related hazards e.g., flooding, drought, extreme cold or high winds and forest fires. Other natural hazards e.g., volcanic activity, subsidence, avalanches and landslides are not expected to affect the mine given surrounding geology and topography. Responses to natural hazards are considered as part of the site EPRP. Potential natural hazards relating to the OMS are discussed here, however further consideration on how to respond to natural hazards is considered in the maintenance and contingency sections.

- Forest Fire; there is potential for forest fire to affect operations of the mine, with the cycle in the area of the RRM being 63 to 210 years. The RRM has a fire prevention and preparedness plan (June 2017) developed with the MNRF.
- Pit Slope Failure; could be cause by flooding or slope instability. Modelling of the 1:100 year flow in the Pinewood River would result in the Pinewood River cresting adjacent to the pit at between 347-349 masl. A berm is proposed to protect the pit. This is the same mitigation proposed as for managing ice jams in the Pinewood River.
- Flooding; there is potential for flooding, and associated rainfall to affect operations of the mine. Design of the dams and diversion structures has considered these events as described in section 4 and contingencies are discussed in section 10. Results of flooding leading to a potential need to discharge additional water is offset by the increased assimilative capacity of the receiving environmental at the permitted 1:1 discharge ratio.
- Drought; drought conditions may result in a reduction in water availability for processing and discharge. Drought conditions for processing is mitigated through the design of the WMP and water storage. In the event of 5^{th} %ile low flow fall, only 1.53 Mm^3 could be discharged. However, this is managed through capacity in the TMA, WMP and water treatment.
- Seismic hazard; the site is located in the Canadian Shield which is comprised of Precambrian granites and gneisses that host some of the oldest rocks in the world. No earthquakes recorded with a magnitude greater than M 4.5 have occurred within approximately 500 km of the site. The results of the probabilistic seismic hazard analysis (PSHA) are shown in Table 3-1. Further details regarding the PSHA are provided in the *2013/2014 Geotechnical Site Investigations Report* (AMEC, 2014d).

4.0 FACILITY DESCRIPTIONS

The components of the RRM relative to the scope of the OMS include tailings and process water management, freshwater diversions and water treatment. The site layout is shown on Figure 3-1. While there is interconnectivity between the systems, for the purposes of the OMS they are categorised in these groupings and reference made between them where required e.g., water management pond, water discharge pond and constructed wetland.

Tailings and process water management are provided by the following;

- Tailings Management Area –TMA (including cells 1, 2 and 3 and associated pipelines);
- Water Management Pond - WMP; and
- Mine Rock Pond - MRP.

The TMA provides long term containment for the tailings. The mill make-up water is reclaimed from the Tailings Management Area (TMA) and the Mine Rock Pond (MRP). The TMA dam raising schedule is divided into five stages and has been set to ensure ample pond storage is available to satisfy mill make-up water supply and effluent management requirements.

The TMA has been designed to optimize natural degradation processes, by ensuring there is sufficient time to allow for heavy metals to precipitate to low levels in the pond. The natural degradation processes are most effective during warm weather conditions when biophysical activity is optimal, and are also augmented by exposure to sunlight.

Freshwater is supplied to the mill from the WMP. Mill make-up water is provided through reclaim from the TMA and the transfer of contact water from the Mine Rock Pond (MRP). Surplus water (effluent) is transferred to the WMP before it is discharged to the environment via the constructed wetland or pipeline to the Pinewood River. Effluents planned for discharge to the environment will be held for a sufficient period under warm weather conditions, to maximize the effects of natural degradation. Such effluent aging will take place mainly in the summer.

Freshwater diversion is provided by the following;

- Clark Creek diversion including the Clark Creek and Teeple dam and diversions; and
- West Creek diversion including the Stockpile and West Creek dam and diversions.

The freshwater diversions function to reduce inflows to the RRM and provide offsetting habitat for the loss of portions of Loslo, Marr, Clark and West creeks. Diversion of the non-contact runoff from these catchments reduces the effluent management requirements. All structures support fish habitat.

Water treatment is provided by the following;

- Water Discharge Pond (WDP) and the Constructed wetland – (CW); and
- Sediment ponds 1 and 2.

Sedimentation ponds have been designed to allow for the settlement of total suspended solids present in the non-contact runoff or effluent prior to discharge to the environment. Sediment Ponds #1 and #2 receive runoff and seepage from the West Mine Rock Stockpile (WMRS). The Water Discharge Pond (WDP) and Constructed Wetland receive discharge water from the WMP. The constructed wetland in the primary and priority discharge location from the WMP (to mitigate flow reductions in the Pinewood River) ahead of discharging to the Pinewood River downstream of McCallum Creek.

4.1 Design Criteria and Basis

The basis for design of the tailings, process water, freshwater diversion and sedimentation dams are summarized in the subsequent sections. Where practically possible, the RRM has been designed to minimize effort at closure by promoting progressive reclamation opportunities including but not limited to: establishing the TMA closure cover and developing the East Mine Rock Stockpile (EMRS) and West Mine Rock Stockpile (WMRS) to closure slopes.

Results from field investigations (subsurface and groundwater conditions) have been incorporated to the design as per the documented findings from the *2013/2014 Geotechnical Site Investigations* (AMEC, 2014d) and *Geotechnical Investigations Report – TMA, Volume 1 – Design Implications* (Amec Foster Wheeler, 2016f).

Table 4-1; Summary of Dam Design Criteria

Dam	Hazard Potential Classification	Upstream Watershed	Maximum Operating Pond Level		Environmental Design Flood		Inflow Design Flood	Spillway design/Emergency Spillway design			Design Slopes
			Volume	Level	Storm Event	Volume		Width	Design Flow	Max. flow depth (IDF)	
-	-	-	Mm3	m	-	Mm^3	-	m	m3/s	m	(_H:1V)
Tailings Management Area											
Cell 1	Very high	None/Tailings		369.9	100 yr 30 day	0.320	PMF	8			11
Cell 2	Very high	Loslo/Tailings		364.05	100 yr 24h	0.828	PMF	19	293.0	1.4	11
Process Water Management											
WMP	Very high	TMA	5.0	369.7	100 yr 30 day	0.630	PMF	8	3.7	0.50	4-9.2
MRP	Very high	EMRS	0.5	356.8	100 yr 30 day	1.0	PMF	15	64.7	1.60	11
Freshwater Diversions											
Clark Creek Dam	Low	Clark Creek		378.75	n/a	n/a	100-yr	20		0.30	5.5
Teeple Dam	Low			378.5	n/a	n/a	100-yr	120		0.10	6.0
Stockpile Pond Dam	Very high	West Creek	0.095 NOWL	372.2	n/a	n/a	PMF	33	79.6	2.30	6.5
West Creek Dam	Very high		0.156 NOWL	361.0	n/a	n/a	PMF	8			7.9

Notes
Hazard potential classification per LRIA
Spillways have been designed to pass an IDF event while satisfying minimum freeboard requirements
PMF is probably maximum flood
To be updated for WDP, CW and Sediment ponds 1 and 2 based on approvals

Table 4-2; Summary of Dam Characteristics

Purpose & Facility	Dam Name	Type of Dam	Construction Method	Crest Elev.	Max. Dam Height	Dam Length	Crest Width	Slopes	Spillway		Normal Freeboard
									Invert Elev.	Width

	Temporary Sediment Pond	Homogeneous	Final, temporary	348.6		600	6	4.0	348.5 (emergency)	60	0.6

Notes:
1) Refer to the relevant design reports for design details.
2) Normal freeboard is the height between the normal pond level and dam crest
3) Emergency spillways are noted in parenthesis for contact water ponds that require Environmental Design Flood (EDF) containment. Otherwise, spillways are working or overflow spillway.
4) Inclinations with an asterisk (*) include toe berms

4.2 Tailings Management Area

Design criteria, including mill throughput, used in the design of the TMA dams is summarised in the follow table. Subsequent sections describe tailings cells 1, 2 and 3 and associated seepage collection systems and supporting infrastructure.

Testing carried out in 2012 for the feasibility study determined that the tailings are non-plastic, predominantly silt sized particles, with 71% of the particles passing the 0.075 mm sieve. The specific gravity is 2.82. Column settling tests (undrained and drained) support a deposited void ratio of 1.0 for deposition planning purposes, inferring a dry density of about 1.4 t/m^3. This is quite typical for hard rock gold tailings. A much more conservative dry density of 1.1 t/m^3 was adopted for the design of the initial start-up cell due to the small footprint and relatively rapid filling.

Table 4-3; Mill and Tailings Operating Data used for design

Revision G	Symbol	Source	Total	Years 1 - 4	Years 4 - 14	Units (metric)

				Total	Total	Total	
Operating data provided (design criteria)							
Ore production							
Resource - Open Pit		A	New Gold	100.1	53.4	46.7	Mt

annual				2,718,085	2,718,085	m^3/y
Mill water balance						
- Water in ore entering the Mill	N	E x G x 30		18,900	18,900	m^3/mo
- Freshwater for glands and reagent mixing	O	E x H		51,881	51,881	m^3/mo
- Water leaving the Mill with the tailings	P	(K / s) - K		719,036	719,036	m^3/mo
- Losses in the Mill	Q	E x I		12,600	12,600	m^3/mo
- Make-up water required to balance the Mill	R	P + Q - N - O		677,326	677,326	m^3/mo

4.2.1 TMA Cell 1

The purpose of Cell 1 is to allow for the deposition of tailings, outside of fish bearing waters i.e., no MMER Schedule 2 requirement. Cell 1 has been designed to contain 3.3 Mm^3 of tailings, or 6 months storage capacity. The dam has a 'very high' hazard potential classification equivalent to extreme hazard classification by the CDA. The design information for Cell 1 is within RRP-GEO-LRIA-004C August, 2016 and the design brief is RRP-GEO-REP-008 R2. A summary of design characteristics is provided in the table below. The IDF for spillway and design is the 24h PMF (516 mm) and the EDF is the 100 year 30 day event. The facility creates a ring dam therefore reducing inflows and water management requirements. As the TMA is raised in stages over the life of mine the cell will become encapsulated within the ultimate TMA facility requiring no change to the closure plan.

The Cell 1 will have a crest elevation of 371.5 masl, and consists of (also see Table 4-4):

- a continuous raise of the TMA south starter dam from elevation 366.5 masl to 371.5 masl between stations 0+000 to 0+800;
- a raise of the TMA west dam (WMP dam 4) from 366.5 masl to 371.5 masl between stations 1+000 to 1+900; and
- a standalone internal containment dam also built to elevation 371.5 masl.

Table 4-4; Summary of Cell 1 Dam Characteristics

	Spillway Invert Elevation (m)	Dam Crest Elevation (m)	Minimum Ground Elevation[1] (m^3)	Maximum Height (m)	Length (m)	Dam Fill Volume (incremental) (Mm^3)
TMA Start-Up Cell Dam	370.5	371.5	360.0	11.5	1,500	1.17
TMA South Dam - Stage 1		371.5	365.0	6.5	800	0.24
TMA West Dam - Stage 1		371.5	363.0	8.5	700	0.19

Notes:
1 Minimum ground elevation noted is original ground

The TMA start-up cell will have a normal operating water level (NOWL) of approximately 369.90 masl at the conclusion of six months of production, which corresponds to the operational pond volume of 200,000 m^3. Once the water level rises above the NOWL it must be pumped from the TMA start-up cell to the WMP at a rate of approximately 57,000 m^3/day, to maintain sufficient capacity to contain the EDF event. Due to the limited storage in the TMA start-up cell at this point in mine operations, no operating range can be allowed (i.e., any water above the NOWL must be

pumped immediately). The TMA Cell 1 spillway has an invert elevation of 370.5 m and a base width of 8 m. The spillway discharges north into TMA Cell 2.

The primary dam construction materials are mine waste rock and select clay (overburden) obtained from a local borrow or from open pit development. The TMA South and West Dam have a clay core with select or processed sand filter/drain zones provided downstream of the core and above the foundation to inhibit the migration (piping) of fine-grained soils under seepage forces. The TMA Start-Up Cell Dam has an upstream bituminous liner to minimize seepage.

Work on Cell 1 is scheduled to be completed in late August with tailings deposition commencing in September 2017, pending approval from MNRF.

4.2.2 TMA Cell 2

The purpose of Cell 2, is to allow for continued operations and tailings deposition, following filling of Cell 1, as the ultimate TMA dams are constructed. TMA Cell 2 has been designed to provide containment for 12 months of tailings deposition based on the design criteria provided in this section (Table 4-1). The dam has a 'very high' hazard potential classification equivalent to extreme hazard classification by the CDA. The Design brief for Cell 2 dam is within RRP-GEO-REP-026 R1 Design Brief, April 28, 2017. A summary of dam characteristics is provided in the table below (Table 4-5). The IDF for spillway and design is the 24h PMF (516 mm) and the EDF is the 1:100 year 24h (127 mm) for containment below the spillway. The 19 m wide spillway with an invert of 364.70 is located in the north starter dam.

The TMA Cell 2 Dam has a crest elevation of 366.5 m which is equal to the crest elevation of the TMA Starter Dams and north starter dam forms part of the containment for tailings deposition. The cell provides containment for approximately 5.5 Mm3 of tailings. The facility is bounded by natural topography (high ground) in the north and by impoundment dams along the remaining perimeter. The facility will be encapsulated during the life of mine when the TMA Stage 2 raise (elevation 371.5 m) is constructed.

The dam section is a central clay core embankment with rockfill shells and a crest elevation of 366.5 m. Sand filter and transition zones are provided downstream of the clay core and a partial blanket beneath the downstream shell. The dam section requires shallow side slopes due to the characteristics of the foundation soils. Clean (NPAG) rockfill is required for construction of the downstream shell. Any rockfill (NPAG or PAG) may be used for construction of the upstream shell (outside Loslo Creek). Given the Schedule 2 approval schedule, 2x1600mm culverts will be placed in Loslo Creek until the approval is received, then these will be grouted and sheet piling used to close the dam.

Work on the dam is scheduled between approval (August) and December for clay placement, and sheet piling across Loslo Creek to be completed in 1Q2018, pending MMER Schedule 2 approval.

Table 4-5; Summary of Dam Characteristics for Cell 2

Tailings Management Area Dam	Spillway Invert Elevation (m)	Dam Crest Elevation (m)	Minimum Ground Elevation[1] (m^3)	Maximum Height (m)	Length (m)	Dam Fill Volume[2] (Mm^3)
Start-Up Cell Dam (Cell 1 Dam)	364.7	371.5	360.0	11.5	1,500	-
North Dam – Stage 1		366.5	363.5	3.0	1,100	-
West Dam (0+000 to 1+000)		366.5	363.5	3.0	600	-
West Dam (1+000 to 1+900)		371.5	363.0	8.5	650	-
South Dam (0+000 to 0+800)		371.5	365.0	6.5	800	-
South Dam (0+800 to 1+250)		366.5	364.5	2.0	300	-
Cell 2 Dam		366.5	356.0	10.5	900	0.47

Notes:
1 Minimum ground elevation noted is original ground.
2 Incremental fill volume to currently permitted structure.

4.2.3 TMA Cell 3

TMA cell 3 is a component of the ultimate TMA bounded by the TMA south starter dam and the Cell 2 dam. Cell 3 will provide containment for tailings/water for approximately 6 month (April to October 2019 prior to adjoining with Cell 2 through a spillway as part of the overall TMA.

The TMA south starter dam is will be built to 366.5 m and has a 'very high' hazard potential classification equivalent to extreme hazard classification by the CDA. The design brief for TMA dams is within Detailed Design Brief Design Brief - Tailings Management Dams 3098004-004000-A1-ETR-0006-00, July, 2014. This was revised following review by the ITRB and, for the starter dams, little design change was required to the 10:1 downstream slopes and the 4:1 upstream slopes (RRP-GEO-MEM-006 Rev 1). A summary of design characteristics is provided in design brief and in the summary table in this section. The IDF for spillway and design is the 24h PMF (516 mm) and the EDF is the 1:100 year 30 day event for containment below the spillway.

When full containment in the TMA is available (i.e. TMA South Dam is constructed to elevation 366.5 m), tailings will be discharged from the north side of the TMA South Dam (upstream slope).

An overflow spillway will connect TMA Cell 2 and 3 to allow for water reclaim during this period of operation. As tailings are discharged from the TMA South Dam, starting in April 2019 (approx.) the pond level in the cell will continue to increase until the water begins to passively overflow at elevation 364.5 m into TMA Cell 2. The TMA Cell 3 Overflow Spillway has an invert elevation of 364.5 m and a base width of 19 m. The spillway will allow TMA Cells 2 and 3 to act as one pond above this invert elevation.

4.2.4 Seepage Collection System

Seepage collection systems have been designed consistent with permitting requirements (MOECC ECA #5178-9TUPD9) to contain seepage and a 1:25 yr 24h storm event (102 mm). However, seepage and runoff reporting to the MRP, from the EMRS and LGOS, is through ditching designed for a 1:100 yr 24h storm event, also consistent with the ECA approval. There is no requirement for seepage collection from the MRP, however, as noted elsewhere in this manual (section 5) the MRP will be managed with a minimum water level to reduce seepage and dewatered in winter to 5,000 m^3.

Seepage collection systems may be modified during construction, however the design criteria will not be reduced.

4.2.4.1 Cell 1

Cell 1 seepage collection is based on continuous ditches reporting to sumps and pump back. Cell 1 seepage details are outlined in RRP-GEO-MEM-043-R1. Seepage to the south east (through WMP Dam 4) is part of inflows to the WMP and managed as part of the WMP water.

Three sumps are proposed with the base of the sump 1 to 2 m below grade to allow for the incoming ditch invert. Combined seepage flow to these sumps is 29 m^3/day and final dimensions are being field fitted. Where required, the downstream side of the ditches will be raised to 362.0 m to prevent back flooding from Loslo Creek. Pumping sizing is intended to drain the sumps within 5 days.

Table 4-6; TMA Cell 1 Seepage Collection Sumps

Parameter	Sump 1	Sump 2	Sump 3
Location	North side of cell 1	East side of cell 1	South of TMA south dam
Seepage flow (m^3/day)	12	7	10
Runoff (m^3/day)	9,321	4,113	5,257
Ditch steady flow (m^3/day)	200	117	173
Storage volume required (m^3)	9,532	4,237	5,440
Pump capacity (m^3/day)	2,500	1,000	1,500

4.2.4.2 Cell 2

Seepage from cell 2 dam has been estimated to be approximately 9.2 m^3/day when the cell is at capacity (364.7 m). Until the TMA south dam is completed i.e., Marr and Loslo Creek are impounded this seepage will be collected and pumped back into Cell 2, as such Cell 2 seepage management is temporary. Sumps and ditching have been designed for a 1:25 year event, consistent with seepage collection commitments;

- Seepage collection sump will be built with ~8,000 m^3 of live storage (NWL 354.0, MOWL 355.5)
- Minimum pumping capacity 1,600 m^3/day to dewater sump in 5 days

Seepage from the north starter dam, is estimated at 0.02 to 0.03 m3/day/m per metre run of dam which will be captured in WMP sump 3.

4.2.4.3 Cell 3

Cell 3 is not anticipated to impound tailings until April 2019 and as such seepage is not anticipated until after this time. Seepage from the south starter dam, is estimated at 0.02 to 0.03 m3/day/m per metre run of dam which will be directed via ditching to the water discharge pond, or if necessary pumped back.

4.2.4.4 WMP

Seepage from the WMP, similar to other dams is designed to be collected in ditches, routed to sumps and pumped back to the WMP. The ditches are designed to convey the 1:25 yr 24h event with flows typically around 5 m^3/s and up to 8.3 m^3/s. The ditches have 1 m bottom width, 3:1 slopes and up to 2 m flow depth. The following table provides a summary of the sumps.

Table 4-7; WMP Seepage Collection Sumps

Parameter	Sump 1	Sump 2	Sump 3
Location	Dam 2	Dam 3	North of WMP by North starter dam
NWL	359.5	358.0	361.5
MOWL	361.1	360.2	364.0
Storage volume required (m^3)	18,200	11,800	20,000
Pump capacity (m^3/day)	4,000	2,500	3,500
Note; Sump 3 to be expanded in 2018 to include seepage from North Dam – Cell 2			

4.2.5 Supporting Infrastructure

Site infrastructure have been constructed with locally available materials produced through the development of the Open Pit or quarrying sand/gravel deposits and bedrock. Figure 3-1 shows the general arrangement of the RRM, including site and haul roads, laydown areas, and stockpiles.

4.2.5.1 Pipelines

There are five pipeline corridors used to transfer tailings, fresh water, and reclaim water on site. Drawing 100126-4500-DD10-PIP-0001.001 shows the key plan of the tailings and reclaim pipelines that interact with the plant site. Drawing 100126-6200-DD10-PIP-0001.001 shows the key plan of the Pinewood Pipeline used for effluent discharge (see Appendix B).

- Tailings Pipeline: the tailings pipelines are 4,000 m in length between the Mill and the TMA and are used to transfer tailings to the TMA for discharge. The tailings line is contained within a lined corridor with six emergency dump ponds. The line is with in additional containment over West Creek and its tributaries.
- TMA Reclaim Pipeline: the TMA reclaim pipeline is 4,000 m in length between the TMA and the Mill and is used to transfer mill make-up water. The reclaim line is contained within a lined corridor with six emergency dump ponds. The line is with in additional containment over West Creek and its tributaries.
- MRP Reclaim Pipeline: The MRP reclaim pipeline is 1,750 m in length between the MRP and the Mill and is used to transfer mill make-up water.
- Open Pit Pipeline: The Open Pit pipeline is 1,400 m in length between the Open Pit and the MRP and used to transfer pit dewatering to the MRP.
- TMA Transfer Pipeline: The TMA transfer pipeline is 2,300 m in length between the TMA and the WMP and are used to transfer TMA surplus water to the WMP.
- WMP Freshwater Pipeline: The WMP freshwater pipeline is 4,000 m in length between the WMP and the plant site and used to transfer freshwater to plant site infrastructure and the Mill (if required).

- Pinewood Pipeline: The Pinewood pipeline is 10,300 m in length between the WMP and the Pinewood Pumphouse. It is used to discharge WMP effluent into the Pinewood River.

4.2.5.2 Utilities

The following utilities are used on site:

- Power to the plant site is provided by 230 kV transmission lines that are connected to Hydro One northwest of the site at a Switching Station;
- The main 230 kV substation is located near the concentrator building to provide power to the process equipment via underground supply lines. Power to the remainder of the site is provided by a network of overhead power lines fed from the main substation; and
- Site telecommunications and Process Control are distributed via fiber optic lines.

4.2.5.3 Tailings Distribution Systems

Mill tailings are produced and detoxified in a cyanide destruction circuit as shown on the process flow diagram 100126-3200-DC00-PFD-0017 (Appendix B). Pipelines to the TMA are shown on the process flow diagram 100126-3200-DC00-PFD-0022 (Appendix B). Tailings are beached from the TMA dams. A wide beach against the dams enhances safety and reduces seepage.

4.2.5.4 Water Circulation Systems

Appendix B contains supporting information for the pumping requirements and design of pumps and pipelines. Mill make-up water is provided from the TMA and MRP. The TMA reclaim recirculates water from the mill after the tailings solids have settled in the TMA. The MRP reclaim pumps water collected from the EMRS and Open Pit/future underground mine. Mill make-up water will be preferentially pumped from the MRP with the TMA supplying the remainder of make-up water.

Freshwater pipelines transfer water to the Plant site for the freshwater requirements at the Mill, as well as to provide water to the truck filling station, truck shop, truck wash facility, and fire water tank. Surplus water in the WMP may also be pumped to the Pinewood Discharge Structure for discharge into the Pinewood River. Details on effluent discharge via the Pinewood Pipeline are described in Section 4.4.

4.2.5.5 Mill Make-up Water Supply

Mill make-up water is provided by reclaim from the WMP, TMA cells and MRP. The reclaim water from the TMA is pumped from the central pond using the following three pumps:

Table 4-8; Make up water supply pump ID and capacity

Equipment ID	Name	Capacity
4520-PU-0023	Process Plant Pumps	1,350 m^3/hr
4520-PU-0024	Process Plant Pumps (Standby)	1,350 m^3/hr
4520-PU-0025	WMP Pump	1,516 m^3/hr

Reclaim water from the MRP is pumped using the following two pumps.

Equipment ID	Name	Capacity
2590-PU-0030	Mine Rock Pond Water Pump	680 m^3/hr

2590-PU-0030	Mine Rock Pond Water Pump	680 m^3/hr

4.3 Process Water and Water Management

Summary of the process water is shown in Figure 4-1 – process flow diagram water flow sheet. Appendix B includes process flow diagrams. Appendix E includes the process water balance for the TMA and WMP includes TMA cells 1, 2 and 3.

RAINY RIVER PROJECT

Process Water Flow Schematic

PROJECT N°: TC111504

FIGURE: 4-1

SCALE: 1:37,500

DATE: August 2014

4.3.1 Water Management Pond

The WMP collects runoff from direct drainage area, pumping from the Pinewood River and receives transfer from TMA. Initially the WMP will be utilized to build an inventory of 3.8 Mm^3 of water required for mill start-up and process operations. The start-up inventory of water will be provided by pumping from the Pinewood River via the pinewood pipeline.

WMP is made up of 5 dams with a crest of 371.5 m and MOWL of 369.7 m. The dams have a 'very high' hazard potential classification equivalent to extreme hazard classification by the CDA. As-built details will be provided in the WMP as-built report to be issued following construction completion. The IDF is 24h PMF with the emergency spillway invert at 370.5 m in bedrock on the north end of dam 5 into cell 2 / Loslo Creek catchment.

All the WMP dams were completed to their final crest elevation in July 2017 and EOR confirmation of compliance was completed on July 27, 2017. The WMP has been developed in accordance with the design details presented in the following documents and drawings. As-built details will be provided in the *WMP As-built Report*, which will be issued within 90 days of construction completion.

The design basis for the WMP includes, but is not limited to, the following;

- Minimum operating volume of 1.0 Mm^3 (i.e., dead storage below the intake for the pumps to the mill); and
- Maximum operating volume of 5.0 Mm^3;

The WMP will discharge via pumping to the Water Discharge Pond (except in winter); and pumping surplus effluent, above 10,000m^3/day, to the Pinewood River (spring and fall). The design criteria for the WMP dams are summarized in section 4.1.

Construction of the WMP began in September 2015 and finished in July 2017. Approval to proceed with the Intermediate Stage of filling to 364.5 m was granted by MNRF in April, 2017. Approval is pending to raise the fill level above 354.5 m to the ultimate elevation, as discussed in section 5.

4.3.1.1 Freshwater Taking from the Pinewood

The Pinewood Water Intake/Discharge Structure is located along the Pinewood River on the outside of a meander bend. The pumphouse is used for the initial filling of the WMP, after which it becomes a discharge structure used to discharge effluent from the WMP.

The Pinewood Water Intake/Discharge has been constructed to support the requirements of the *Water Management Plan for Operations* (Amec Foster Wheeler, 2015a). These features are illustrated in the following drawings:

4.3.2 Mine Rock Pond

The Mine Rock Pond has been designed to collect runoff and seepage from the East Mine Rock Stockpile (EMRS), Low Grade Ore Stockpile (LGOS), and dewatering from the Open Pit and future underground mine. The MRP design details are summarized in the following documents and drawings with the latest revision RRP-GEO-MEM-019 R0 – AMECFW 2016h. The dam has a ‘very high’ hazard potential classification equivalent to extreme hazard classification by the CDA. As-built details will be provided in the MRP as-built report to be issued 90 days following construction completion.

Document Title	**Reference**
Design Brief – Water Management Dams	(Amec Foster Wheeler, 2015b)
Mine Rock Pond Dam – Design Revision and Operating Guidelines	(Amec Foster Wheeler, 2016h)
MRP As-built Report	TBD
Drawing Title	**New Gold Document Number**
Mine Rock Pond Dam – Typical Cross Section	3098004-002590-A1-D70-0004
Interim Mine Rock Pond – Plan, Cross Sections, and Details	3098004-002590-A1-D50-0006

The design criteria for the MRP ultimate dams are summarized in section 4.1. Typical dam cross sections are provided on Drawings 3098004-002590-A1-D70-0004 for the MRP ultimate dam. The design basis for the MRP includes, but is not limited to, the following:

- 24h PMF and 1:100 year 30 day storm
- Maximum operating water volume: 0.5 Mm^3;
- Maximum water stored: 1.3 Mm^3;
- Minimum operating water volume: 0.05 Mm^3;
- Constructed from local materials as a clay core and rockfill embankment; and
- Decant pumping to the Mill via pipeline is at a rate of up to 680 m^3/hr.

The dam crest elevation is 360.2 m with an emergency spillway invert of 358.9 m. The available pond storage at the emergency spillway invert is reduced to 1.3 Mm^3. The MRP pumps will pump 680m^3/hr, and run continuously until the pond is empty. This 30% increase to the pumping rate and change in pumping philosophy means the normal pond will range between 5000 m^3 and about 525,000 m^3 depending on the open pit dewatering pump capacity. The larger decant pumps also mean that the EDF capacity required in the MRP is 775,000 m^3. The Maximum Operating Water Level (MOWL) in the MRP has been set at elevation 356.8 m (525,000 m^3).

Completion of the Mine Rock Pond Dam commenced in 2015, and with a hiatus in 2016, is expected to be completed in the fall of 2017. Until the dam is complete, runoff and seepage water from the EMRS will be diverted to the temporary Sediment Pond system located within the north portion of the ultimate MRP footprint and discharged to the remnant Clark Creek.

4.4 Water Treatment

At the time of preparation for this revision the constructed wetland and sediment ponds 1 and 2 have not been constructed or received all regulatory approvals. Based on the anticipated MMER schedule 2 approval timing, construction of these facilities is planned for 2018. The following section provides a summary of their design and intended operation, which is intended to be updated on receipt of all regulatory approvals.

4.4.1 Water Discharge Pond and Constructed Wetland

The Water Discharge Pond (WDP) has been designed to collect runoff from natural ground catchment south of the TMA, seepage from the seepage collection ditch, and bleed flow from the WMP (design rate of 10,000 m^3/day) for discharge to the constructed wetland. The WDP will also provide sediment control south of the TMA.

The constructed wetlands collect the water discharged from the WDP. They have been designed to provide a target 30-day retention time following discharge from the WDP. The wetlands are comprised of five ponds (Pond A, B, C, D, E), and the downstream pond (Pond A) will feature a control structure to stop discharge if the water quality does not meet discharge criteria. If required, water in Pond A would be pumped back to the TMA or WMP.

The design criteria for the Water Discharge and constructed wetland dams and ponds are provided in Tables 4-3 and 4-5, respectively. Further design details and typical cross-sections of the effluent dams are provided in the following documents:

Table 4-9; Water Discharge Pond and Constructed Wetland Documents

Constructed Wetland – Plan, Profiles & Section	3098004-004420-A1-D70-0002

4.4.2 Sediment Ponds 1 & 2

Sediment Ponds #1 and #2 collect seepage and runoff from the West Mine Rock Stockpile (WMRS) to allow for settlement of Total Suspended Solids (TSS). The sediment ponds have been designed to provide a 12-day hydraulic retention time. Sediment Pond #1 will also receive overflow water from the West Creek Overflow Weir during large storm events. Critical to the function of the sediment ponds is progressive reclamation. The ponds have been designed to meet the retention time objectives for Year 3 of mine operations. Further details on design are provided in the following documents:

Table 4-10; Sediment Ponds 1 and 2 Design Detail Documents

Document Title	Reference
LAKES AND RIVERS IMPROVEMENT ACT WORK PERMIT APPLICATION SUPPORT DOCUMENT SEDIMENT PONDS	RRP-GEO-LRIA-012 R1
As-built Report	TBD
Drawing Title	**New Gold Document Number**
Sediment Pond #1 – Sections & Details	3098004-004430-A1-D70-0002
Sediment Pond #2 – Plan, Cross Sections, and Details	3098004-004440-A1-D70-0002

After 2018, progressive rehabilitation would be required to reduce the sediment load on the ponds, or the ponds could be increased in size. After 3 years of mine operations, a better estimate of sediment loading from the stockpile area should be available to adequately design for additional area as required.

Seepage collection ditches will be constructed around the Overburden and NPAG stockpiles to convey runoff to the sediment ponds. The ditches will be constructed to minimize erosion protection requirements where practically possible. Flows may also be directed to the ponds using road side ditches.

Good engineering practices for placement, sediment and erosion control will be adopted for the management of the overburden pile to help reduce the sediment load and increase the chance that settling alone (as opposed to the addition of coagulants and flocculants) can be used for settling out the TSS. These practices include pre-settling ponds that are regularly cleaned out, construction of ditches with appropriate slopes, maintenance of the ditches, and progressive re-vegetation of the overburden stockpile.

4.5 Freshwater Diversion Dams and Channels

The freshwater ponds are designed to minimize the net freshwater inflows into the project by diverting non-contact runoff around the site via dams, ponds and diversion channels. The West Creek Pond, Clark Creek, Stockpile Pond and Teeple Road dams were developed in a single dam raise during the construction phase to support the requirements of the *Water Management Plan for Operations* (Amec Foster Wheeler, 2015a). Additional details regarding these dams, ponds, and diversion channels are provided in section 4.1.

The freshwater diversion structures have been developed in accordance with the following design briefs. As-built reports have been issued. A detailed list of Drawings is provided in Appendix A.

Notes
1) Low flow and fish habitat features are included in all diversion channels below the hydraulic flow section

4.5.1 West Creek Diversion

The West Creek Diversion system diverts flows from the West Creek and its tributaries around the Open Pit and discharges into the Pinewood River at Loslo Creek. It includes the Stockpile Pond Dam and Diversion Channel, which divert flows around the Plant Site, and the West Creek Pond and Diversion Channel, which divert flows around the Open Pit. The dams have a 'very high' hazard potential classification equivalent to extreme hazard classification by the CDA. The following sections describe the components of this diversion.

4.5.1.1 Stockpile Pond and Diversion Channel

The objective of the Stockpile Pond is to divert freshwater from natural ground into the West Creek Watershed. The Stockpile Pond Diversion Channel was designed to convey the Probable Maximum Flood (PMF) from the plant site area to the West Creek Pond. The Stockpile Pond Diversion will also provide fish habitat compensation. The Stockpile Pond Diversion Channel base width varies from 6 to 33 m with 4H:1V side slopes. The total length of the diversion channel is about 1,200 m.

The dam height is 7.5 m with 4:1 slopes with a crest width of 6 m and length of 175 m. The dam crest elevation is 375.5 m and the diversion channel invert is 372.2 m. NOWL provides capacity for 93,700 m^3 of storage with greater volumes discharges through the 33 m spillway into the diversion channel. The diversion channel is a low (<1%) gradient channel reporting to the West Creek Pond with a typical bottom width of 6 m.

The design brief for the dam is RRP-GEO-REP-003. Construction was completed on the diversion in November 2016 and confirmed by the EOR (RRP-GEO-MEM-080-R1). Construction of the dam was completed in May 2017 and confirmed by the EOR (RRP-GEO-MEM-119-R1). The dam was constructed with a central clay core and random fill and or NPAG rock shells.

4.5.1.2 West Creek Pond and Diversion Channel

The West Creek Pond is located upstream of the Open Pit and west of the Process Plant at a point that allows for the raising of the pond water level sufficiently to divert flows westerly through a diversion channel and around the Open Pit. The West Creek Dam intercepts all West Creek flows from the north, as well as drainage from two tributaries to the east, diverted through the Stockpile Diversion Channel.

The West Creek Dam is a central clay core with random fill upstream shell and NPAG mine rock downstream shell. It has a crest elevation of 364.9 m (~156,000 m^3), maximum height of 7.4 m, and overall side slopes of 7.9H:1V including rock toe berms. The West Creek Pond has been designed to contain the PMF while discharging to the West Creek Diversion Channel.

The first 615 m of the West Creek Diversion Channel acts as the Emergency Spillway of the West Creek Dam and has been designed to convey a PMF event. The spillway invert elevation is 361.0 m and is 8 m wide. This provides a freeboard of 4.0 m at normal water level in the pond. During a PMF event the peak water level would rise to 364.5 m, leaving 0.4 m of freeboard.

4.5.1.3 West Creek Diversion Overflow Structure

The Overflow Structure (or weir) is located at Sta. 0+615 within the Diversion Channel. A box culvert (62.5 m long by 2.4 m wide/tall) constricts the channel flow such that a side overflow weir may be activated (invert elevation 360 m, width 50 m). The purpose of the overflow structure is to restrict the flow rate discharging from the culvert under high flow conditions. The remaining ~4,000 m of diversion channel is over flat ground with minimal elevation change. The reduced flows through this section of diversion channel allow a much smaller channel excavation.

The overflow structure has been designed such that during a PMF event, the flow rate downstream of the culvert, i.e., in the channel, does not exceed the 100-year flood outflow from the West Creek Pond (26.9 m^3/s). The diversion channel upstream of the diversion structure will back up, with excess flows diverted through the side overflow channel. Containment is provided above the culvert by a berm across the diversion channel with a crest elevation of 363 m. The peak water level in the diversion channel during a PMF event will be 362.5 m, providing 0.5 m of freeboard to the crest of the berm.

The overflow structure will be activated for events greater than the 10-year storm. The peak overflow channel discharge during a PMF event will be 163.8 m^3/s. The overflow channel discharges onto a flat, grassy plain south of the West Creek Diversion Channel and north of the ultimate WMRS. This area, termed the exclusion zone, is shown on Figure 4-2 and is required to remain undeveloped to prevent the loss of natural vegetation until Sediment Pond 1 berm is constructed, north of the WMRS. In the field, this area is demarcated by bright coloured stakes and ribbons. The ground topography will naturally drain any overland flow through Culvert C15 into Marr Creek.

RAINY RIVER PROJECT

West Creek Diversion Structure Pre-Production Conditions

PROJECT Nº: TC150321	**FIGURE: 4-2**
SCALE: 1:6,000	DATE: March 2017

4.5.2 Clark Creek Diversion

The purpose of the Clark Creek diversion is to divert natural drainage and runoff around the East Mine Rock Stockpile and provide fish habitat offsetting. The Clark Creek Diversion Channel diverts runoff from the Clark Creek upstream of the Clark Creek Dam and the EMRS, through the Clark Creek diversion channel into Teeple Pond and subsequently into Teeple Diversion and to the Pinewood River via a culvert under Teeple Road.

Construction of the Clark Creek Diversion occurred between August 29, 2015 and December 4, 2016 and authorised by LRIA FF-2015-03A and the Fisheries Act approval. There are applicable federal and provincial EA commitments, however as a freshwater diversion there a limited MOECC requirements beyond sediment control.

Clark Creek and Teeple Road Dams were constructed as homogenous clay fill embankments utilizing native clay overburden. The clay fill is protected by gravel and cobble sized materials, with a layer of geotextile separation, to prevent erosion. Overflow sections for Teeple Dam are included on the dams to carry storm flows (i.e., activated by 2-year event) and have been designed to handle events in excess of the 100-year return design flow. Overflow sections are provided to permit the safe passage of water in the event the pond level exceeds the maximum operating water level. There are no active controls on the water flows. Clark Creek Dam features a 20 m wide overflow section and Teeple Road Dam features a 150 m wide overflow section designed to allow water and fish to flow over the structure.

The diversions are designed to convey the 1:100 year flow and are typically 6 m wide (base width) with 4:1 slopes. The Clark Creek diversion is 1,200 m and the Teeple Diversion is 580 m long.

Table 4-13; Design Parameters for the Clark Creek Diversion

Design Parameter	Unit	Clark Creek	Teeple
Embankment dam crest elevation	m	380.0	379.0
Dam overflow section invert elevation	m	379.9	378.7
Normal Water Level (NWL) elevation	m	378.75	378.5
Diversion channel inlet invert elv.	m	378.75	378.5
Diversion channel outlet elv.	m	377.6	371.5
Diversion channel gradient (average)	%	0.1	1.2
Diversion channel side slopes		4:1	4:1

Deviations from design occurred for both diversions, however not anticipated to have a negative effect of stability. Examples of deviation include absence of low flow channel, oversized boulders, variances on habitat feature frequency and riffles either not meeting design elevation or being too steep

4.6 Instrumentation

4.6.1 Dam Safety

Instrumentation has been and will be installed during construction. Instrumentation will include instrumented dam sections that will monitor dam foundation and clay fill pore pressures to infer consolidation characteristics, as well as monitor any movement of dam fill due to deformation.

Each dam instrumentation section will include: standpipe(s), a settlement plate, slope inclinometer(s), survey pins/monuments, and a terminal arrangement with data logger and vibrating wire piezometers.

Following construction, the instrumentation will remain for dam monitoring purposes. A detailed report containing the proposed locations, usage, and analysis of all instrumentation is provided in the *Geotechnical Monitoring Plan* (Amec Foster Wheeler, 2016b). The design details for the installed or proposed dam instrumentation is summarized in Table 4-14. The design information provided in Table 4-14 will be confirmed and updated as may be required following development of the As-Built drawings.

Notes:
1) Survey pins installed at 100 m centres along 3-5 lengthwise lines (crest, toes, etc.) Quantities are total for each dam
2) TMA Dams feature mass array of VWP instruments installed in grids within the dam foundation. Installation of these instruments is currently on-going

In addition to the instrumentation described above, the TMA dams are equipped with an additional suite of vibrating wire piezometers (VWPs) to provide enhanced monitoring resolution during construction. A total of 524 VWPs were installed in the TMA dam foundations, arranged in a grid pattern, and managed with a remote wireless data acquisition and management system.

Instrumentation associated with the management of the dams is being managed through a software system that includes integration with data loggers and data storage and is configured

such that alarms for alert levels are defined and available. The software routinely generates reports and if trigger levels are exceeded sends out alarm notifications.

4.6.2 Other instrumentation

Additional instrumentation to support the OMS manual and management of water includes;

- Densometer on the tailings pipeline;
- Flow meters on the water management pipelines including from the Pinewood River, tailings reclaim lines, MPR line and freshwater line from the WMP and
- Pressure transducers in the WMP, Clark/Teeple Ponds.

This instrumentation provides continuous recording, which is collected during routine inspections and included.

4.7 Regulatory Requirements

Regulatory requirements, permits and authorizations are summarized in section 1.1. Key approvals include the Federal and Provincial Environmental Assessment conditions and commitments and permits including those issued pursuant to the LRIA and EPA. Additional legislation to be considered in implementing the OMS manual includes the MMER and various Ontario regulations including waste management.

No direct discharges are intended from any of the structures described in this section except the WMP which is described in sections 4 and 5. Seepage will be collected and pumped back from the WMP and TMA cells. Subsequent to this revision and LRIA approvals, additional details for the WDP, CW and sediment ponds discharges will be developed.

5.0 OPERATIONS

The overall operational objectives of the TMA and associated dams and facilities are to dispose and store the tailings and to manage all site water in a safe, economical and environmentally responsible manner. This section defines operating standards in accordance with design criteria and regulatory requirements specified in section 4.

5.1 Tailings transport and deposition

The RRM mill will be commissioning in fall 2017 with a design throughput of 22,000 tpd. As discussed in further detail in Section 4, final expected effluent quality results indicate that a high-quality effluent approaching ECA permit values can be achieved through a combination of in-plant cyanide destruction using the SO_2/Air process combined with natural aging in the TMA and the WMP.

5.1.1 Tailings Transport

Tailings will be pumped from the tailings pump box in the mill to the TMA and deposited as outlined in the tailings deposition plans (section 5.1.2) and Appendix D. The tailings and reclaim lines are HDPE pipe and are within lined containment and held in place with clay anchors. The lined containment drains to one of six emergency dump ponds located along the tailings corridor.

5.1.2 Tailings Deposition

The life of mine tailings deposition report (Document 3098004-004000-A1-ETR-0005) is being updated to reflect the operation of Cells 1 and 2. The deposition plan described here is based on the planned revisions. The tailings deposition plan involves discharging tailings from the crest of the dams to produce wide tailings beaches to enhance dam stability and inhibit seepage. In the non-winter months, spigotting will be carried out, with pipeline end-discharge in the winter once suitable beaches are present.

5.1.2.1 TMA Cell 1

Deposition will commence in the start-up cell (TMA Cell 1), which is planned for a total period of six months (October 1, 2017 to March 31, 2018 approx). During this period, supernatant water will be continuously pumped to the WMP. Table 5-1 provides an overview of the tailings deposition volumes and elevations. Tailings deposition for cell 1 is discussed in more detail in the LRIA application (RRP-GEO-LRIA-004C R1 Comments and Responses).

Table 5-1; Cell 1 Tailings Deposition

	Tailings		Water	
Time Elapsed	**Volume**	**Discharge Elev.**	**Volume**	**Pond Elev.**
(months)	**(m^3)**	**(m)**	**(m^3)**	**(m)**
<1	130,000	362.0	10,000	<362.0
1	580,000	366.0	200,000	365.0
6	3,300,000	371.4	200,000	369.9

Notes: Supernatant and water will be transferred to the WMP daily by pumping, recirculation to the processing plant via WMP intake pumps

Tailings pipelines will follow the TMA South Dam alignment and branch off to the TMA Start-up Cell Dam and West Dam. Spiggotting of tailings into the TMA Start-up Cell (TMA Cell 1) will occur from the TMA South, West, and Start-up Cell Dams, forming a beach upstream of these dams and a central pond that will be pumped into the WMP from the north end of the cell.

Spiggotting will initially occur into a borrow area not exceeding 362 m i.e., below the toe of the start up cell dams. The tailings discharge rate is 5,000 m^3/day to 9.000 m^3/day into the borrow, and will be measured by a flow meter on the tailings line reporting to the borrow. This initial volume of tailings will backfill Borrow Area B6 within the footprint of the start-up cell and will not exceed 130,000 m^3, and will remain below elevation 362.0m. The top of tailings surface will not contact any of the toes of the TMA dams forming the start-up cell until approval to operate the TMA / Start-up Cell has been granted by the MNRF.

For operation of the borrow, the normal operating pond volume is 10,000 m^3. The maximum operating water level is 361.9 m. If the MOWL is exceeded tailings discharge will cease and the pond drawn down by pumping to the WMP (e.g., 2 tractor pumps at a combined capacity of 40,000 m3/day). A staff gauge will be installed in the SW corner of the borrow (furthest from the tailings discharge), which will be monitored twice per 24h period (every 12h approx.). Within the borrow the volume of storage is 80,343 m^3, 104,276 m^3 and 164,005 m^3 at elevation 360.0, 361.0 and 362.0 respectively.

Upon regulatory approval for tailings deposition into Cell 1, tailings will be discharged from an elevation of 366.0 m. Areas where the ground elevation is higher than 366.0 m will not discharge tailings (i.e. the high ground around the dam abutments). By month 6 of deposition, the discharge elevation will be moved up to 371.4 m and spiggots will discharge from the south, west, and east sides of the cell. Provisions will be made, as required, to facilitate ongoing construction while discharging tailings.

Cell 1 will not discharge to the environment and there is no reclaim direct to the mill, for dam safety and emergency spillway to the north at elevation 370.5 has been constructed. The TMA start-up cell will have a normal operating water level (NOWL) of approximately 369.90 masl at the conclusion of six months of production, which corresponds to the operational pond volume of 200,000 m^3. Once the water level rises above the NOWL of 369.90 m, it will be pumped to the WMP at a rate of 57,000 m^3/day to contain the EDF event. Due to the limited storage in the TMA start-up cell at this point in mine operations, no operating range can be allowed (i.e., any water above the NOWL must be pumped immediately). During operation of Cell 2, cell 1 will passively overflow into Cell 2.

Figure 5-1; TMA Cell 1 Borrow Stage - Storage Relationship

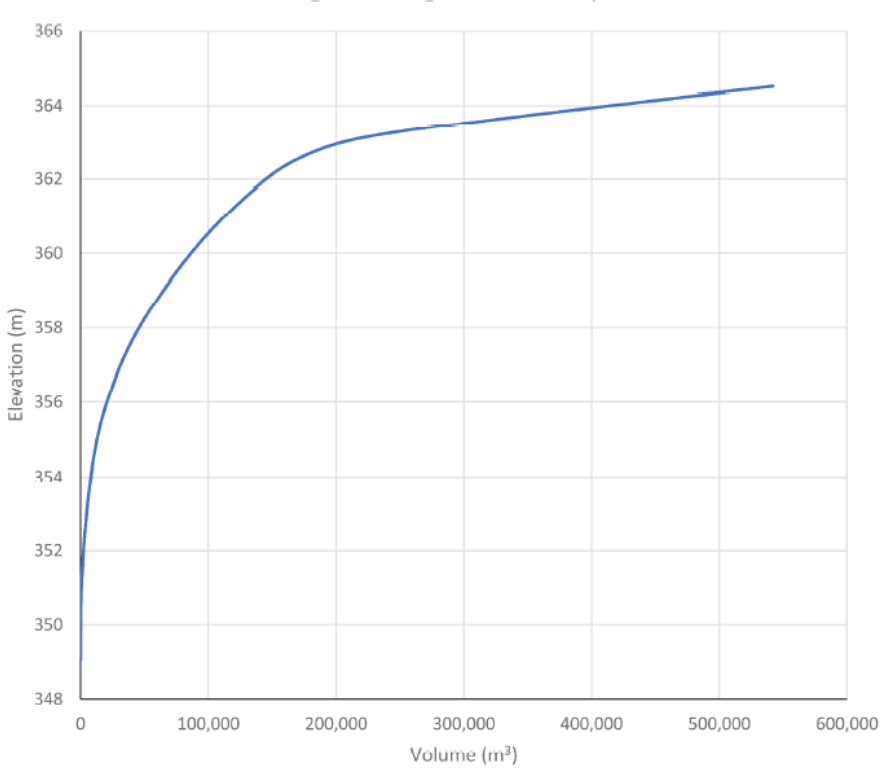

Figure 5-2; TMA Cell 1 Stage Storage Relationship

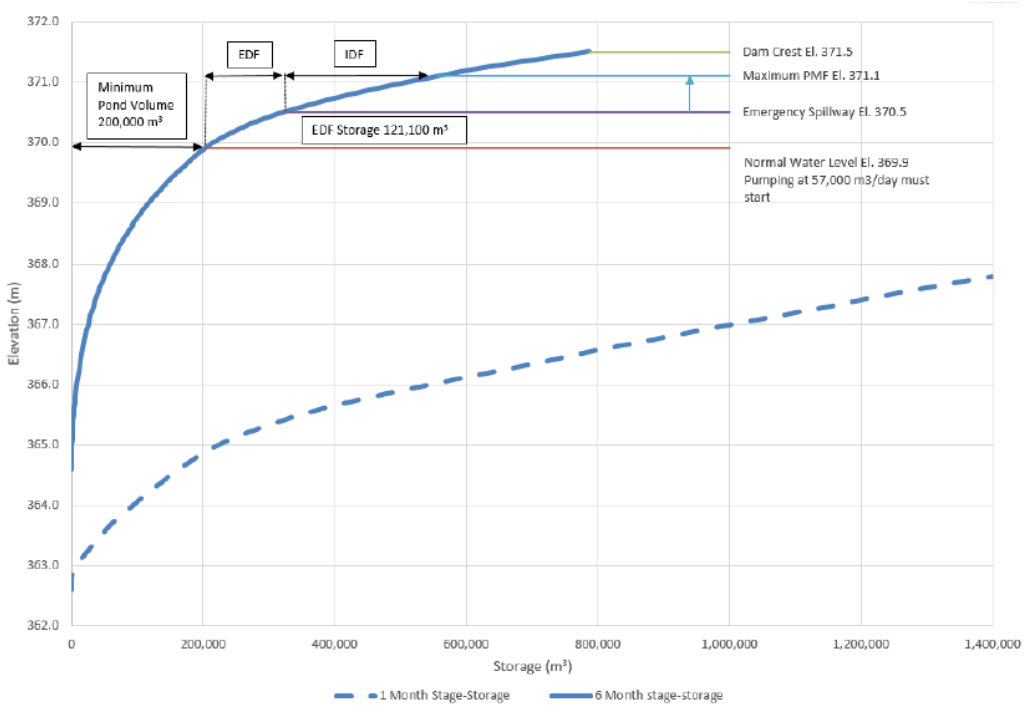

5.1.2.2 Future Tailings Deposition – Cell 2 and Cell 3

Cell 2 provides for 12 months (April 2018 to April 2019 approx.) of tailings deposition (5.5 Mm^3 of tailings) with a crest elevation of 366.5 m. 12months is the maximum permitted operating duration for cell 2. Following completion of this dam, and approval from MNRF, Cell 2 will operate as described here based on RRP-GEO-REP-026 R1, April 28, 2017 or as updated in the as-built report. A stage storage relationship is provided below.

- Tailings will be discharged from the northwest side of the dam (upstream slope) for 6 months. This will be followed by discharging from the downstream slope of the TMA Cell 1 Dam for an additional 6 months (or until the TMA South Dam is completed to elevation 366.5 m).
- Surplus water from TMA Cell 1 will overflow by gravity into TMA Cell 2 through the existing emergency spillway. A pond will form in the northwest end of TMA Cell 2 and be reclaimed to the mill via the reclaim line or transferred into the WMP.
- The MOWL of Cell 2 is 364.05 m providing 1 Mm3 of storage below the 19 m wide north dam spillway invert (364.7 m) to contain the 828,200 m3 EDF. This will be maintained at all times.

- The spillway will provide 0.39 m of freeboard from the maximum still pond IDF level (366.11 m) to the dam crest (366.5 m)
- Water reclaim to the mill from TMA cell 2 is to occur once water levels in the WMP are below 1.0 Mm^3. At minimum pumping will commence once Cell 2 pond volume increases to within approx. 800,000 m^3 of the MOWL and will continue until water levels are 1.2 Mm^3 below the MOWL.
- Pumping capacity of 40,000 m^3/day between TMA Cell 2 to Cell 3 and to the WMP will allow for management inflows to cell 2. As contingency, pumping will be considered from the WMP to TMA Cell 3 to reduce WMP volumes below 1.0 Mm3 prior to discharge from the WTP.

When full containment in the TMA is available (i.e. TMA South Dam is constructed to elevation 366.5 m), tailings will be discharged from the north side of the TMA South Dam (upstream slope) into an area referred to in this report as TMA Cell 3. Cell 3 will be constructed for completion in June 2018, at which time it will be used to manage excess water from cell 2 and the water impounded in the WMP (as described in this manual).

An overflow spillway is detailed for construction at the left abutment of the TMA Cell 2 Dam once the TMA South Dam is constructed to elevation 366.5. This overflow spillway (at 364.5) will provide a conduit to connect the TMA Cell 3 pond with the TMA Cell 2 pond and ultimately with the reclaim/transfer pumps. It's anticipated tailings deposition will occur for 6 months until this occurs.

5.1.3 Dam Raising

The dams will be raised to maintain discharge availability and sufficient pond storage capacity to contain the Environmental Design Flood (EDF).

5.2 Seepage Collection System

Seepage collection systems, as described in section 4, are in place and required for the WMP and TMA only. The design criteria of 1:25 yr 24h rainfall results in seepage systems (sumps, pumps and ditches) as described in section 4 (including MOWL) and summated here;

- Cell 1 seepage is not expected to exceed 29 m^3/day. Three sumps will be pumped back to Cell 1 with pumping capacity of 2,500, 1,000 and 1,500 m^3/day respectively. Sumps 1 and 2 pumping will cease once Loslo Creek is impounded by the TMA south dam (June 2018 approx);
- Cell 2 seepage is expected to not exceed 9.2 m^3/day and a sump of 8,000 m^3 will be pumped back to Cell 2 with pumping capacity of 1,600 m^3/day until Loslo Creek is impounded by the TMA south dam (June 2018 approx);
- Cell 3 seepage is intercepted and routed by ditch into the water discharge pond, and isn't expected to occur until June 2018 (approx.); and
- WMP includes 3 sumps, including a sump shared with the north starter dam and will be pumped back to the TMA, capacity of the sumps is 18,200, 11,800 and 20,000 m^3 for sumps 1, 2 and 3 respectively with pumping capacities of 4,000, 2,500 and 3,500 m^3/day respectively.

5.3 Process Water Management

The following detail design drawings will be referred to while reviewing the design details for the process water management: Additional design details for the process water dams and ponds are provided in section 4. A list of drawings are provided in Appendix A.

During the pre-production phase, process water management will involve filling the WMP and MRP, followed by pumping to the plant site during mill commissioning and start-up. The WMP will also supply the truck filling station, truck shop, truck wash facility, and fire water tank.

These processes are illustrated on the following Process Flow Diagrams:

- Water Reclaim Sheet No. 1 (100126-3200-DC00-PFD-0021.001); and
- Water Reclaim Sheet No. 2 (100126-3200-DC00-PFD-0021.001).

Additional details regarding pumping requirements, as well as pump and pipeline designs, are provided in Appendix B.

5.3.1 Water Management Pond

The WMP collects runoff from direct drainage area, pumping from the Pinewood River and receives transfer from TMA. Initially the WMP will be utilized to build an inventory of 3.8 Mm^3 of water required for mill start-up and process operations. The start-up inventory of water will be provided by pumping from the Pinewood River via the pinewood pipeline. However, additional water sources maybe utilised in filling the WMP including but not limited to:

- Pumping from Open Pit via a 6” pipeline;
- Pumping from Sump #4 (Open Pit) via 16” / 20” / 24” pipeline; and
- Direct drainage of natural runoff.

During late construction (starting April 27, 2017 from the Pinewood River), the WMP began filling and storing water prior to achieving the final dam crest elevation, as per approval from the MRNF. The start-up inventory of water will be primarily pumped from the Pinewood River, in addition to collecting natural runoff and dewater pumping from the Open Pit. Filling the WMP will occur in two stages:

- Intermediate stage: maximum water level 364.5 m providing 2.0 m of freeboard below the minimum dam crest elevation of 366.5 m
- Final stage: maximum operating water level 369.7 m

During the Intermediate Stage of filling the Interim Fill Plan (rev3 – March 2017) will be followed,

- all WMP dams were constructed to a minimum crest elevation of 366.5 m and width required to satisfy slope stability requirements. The maximum water level in the WMP shall not exceed 2.0 m below the lowest constructed dam crest elevation, i.e. 364.5 m.
- monitoring of water levels and instrumentation will occur daily, and water quality (TSS) will be sampled twice weekly, water quality will be sampled weekly and dam inspections will occur weekly
- Contingency will be maintained with an 8 inch pump ready to discharge to the approved location north of WMP Dam 4, and when water is above 364.0 a 12 inch pump will be mobilised

All the WMP dams were completed to their final crest elevation of 371.5 m in July 2017 and EOR confirmation of compliance was completed in on July 27, 2017. The requirements for the Final Stage of filling have been met and the maximum operating water level may be raised to 369.7 m, pending MNRF approval. Final filling of the WMP will be completed based on water takings from the Pinewood River and other approved water takings.

During the use of TMA Cell 1 and Cell 2, WMP filling will consider mill water needs the overall water balance and water quality discharge criteria based on the WMP water balance (Rainy River Project Development TMA Cell 2 and WMP Water Balance RRP-GEO-REP-026 R1).

- At the end of March 2018 WMP volume will be approx. 2.0 Mm^3, 50 % of which will be ice
- Water will be pumped during freshet (April – June 2018) from Cell 2 and the Pinewood River to increase the volume in the WMP
    - Pumping from the Pinewood is proposed if the total water volume in the WMP and TMA Cell 2 is below 4 Mm^3.
- The mill water use will maintain the WMP below the MOWL till June 2018 (approx.) and target a reduction of water levels to 1.0 Mm^3 stored volume i.e., dead storage
- After June 2018 (approx.) mill reclaim will switch to TMA cell 2 and excess water from Cell 2 will be pumped to Cell 3 (subject to TMA completion and regulatory approval) while the water treatment plant is constructed in the WMP adjacent to Dam 4.

Once the WTP is constructed and operational (prior to September 2018) the WMP will received treated (or blended untreated) supernatant from Cell 2 and subsequently the ultimate TMA. Operations will continue to meet MOECC requirements such that:

- Supernatant will be transferred from the TMA during June to August (or other times during the year to achieve overall water balance and water treatment objectives);
- Discharges effluent to environment: Preferentially bleed flow through constructed wetland with a 30-day retention time (design volume of 10,000 m^3/day) – estimated to commence in Spring 2019; and
- Decant to Pinewood River (through discharge pipeline);
- No discharge to occur between December 1 and the following spring melt (defined as a flow rate in the Pinewood River (upstream of Loslo Creek) of 10,000 m^3/day.

Bleed flow and decant to Pinewood River can only occur if there is sufficient flow in the Pinewood River to achieve a minimum mixing ratio of 1:1 with the two discharges combined. A pre-winter inventory of 2.8 Mm^3 will be targeted (to comply with environmental commitments to supply the bleed flow through constructed wetland in all climatic conditions). This is calculated from the sum of the outflows from the WMP between December and the following May;

- -0.04 Mm^3 seepage losses
- -0.10 Mm^3 evaporation losses
- -0.76 Mm^3 bleed to wetland
- -0.90 Mm^3 ice allowance

- 1.0 Mm^3 minimum inventory.

This volume is sufficient to maintain supply to the mill through dry winters and springs, up to the beginning of June, at which time the transfer from the TMA can replenish the WMP inventory. The mill make-up water demand is 22,605 m^3/day which will be supplied by the MRP and WMP. The make-up water will be preferentially taken from the MRP with the WMP supplying the difference. The Mill requires freshwater for reagent mixing at a rate of 1,729 m^3/day which will be supplied from the WMP.

Figure 5-5; Stage - Storage Curve for the WMP

5.3.1.1 Pinewood River Pump House

The Pinewood River pump house shall not exceed the maximum water intake of 20,000 litres/minute as per Permit to Take Water (PTTW) number 8776-9W2QN3 which expires November 30, 2018. Additional seasonal restrictions to the water taking as stipulated in PTTW number 8776-9W2QN3 include:

- March 1 through July 31: the water taking to an amount not more than 20% of the daily flow rate (as measured at the water intake location, and including allowance for site watershed capture) and that the calculated flow rate after pumping in the Pinewood River remains above 10,000 m^3/day;
- August 1 through November 30: the water taking is restricted to an amount not more than 15% of the daily flow rate (as measured at the water intake location, and including allowance for site watershed capture) and that the calculated flow rate after pumping in the Pinewood River remains above 5,000 m^3/day; and
- December 1 through February 28: no water taking in the Pinewood River shall occur.

This approval was amended till August 31, 2017 to allow for additional water takings;

- The total combined water taking (including all PTTW sources) from the Pinewood River can increase to not more than 30 % of the daily flow where 43,200 m3/day is the minimum flow threshold for this level of water taking
- The total combined water taking (including all PTTW sources) from the Pinewood River can increase to not more than 20 % of the daily flow where 10,000 m3/day is the minimum flow threshold for this level of water taking

The water taking for the day (24h period) is calculated based on a 24h period of flow in the previous 72h as measured consistent with the Pinewood hydrometric monitoring plan. This uses either the New Gold hydrometric station or the WSC hydrometric station at Hwy 617, consistent with MOECC approved plans. Monthly and annual reporting of takings is provided to MOECC.

5.3.2 Mine Rock Pond

The pond collects runoff and seepage from the East Mine Rock Stockpile (EMRS) and Low Grade Ore Stockpile (LGOS) and receives dewatering from the Open Pit and future underground mine.

Currently, the MRP Dam is not complete and the remnant Clark Creek drainage is required (by LRIA approvals) to be diverted through the construction diversion ditch to the remnant Clark Creek. Following completion of this dam, and approval from MNRF, the MRP will operate as described here based on RRP-GEO-REP-007 R1, September 15, 2016. A stage storage relationship is provided below.

- The MRP will be operated to minimize volume in the pond to reduce seepage and for increased dam safety, there is no seepage collection system for the MRP as it is the seepage collection system for the EMRS.
- The MOWL of the MRP is 356.8 m (525,000 m^3) and has been constructed with an 80 m spillway at an invert of 358.9 m (1.3 Mm^3) to store the EDF (775,000 m^3).
- The MRP will operated with a freeboard of 3.4 m to allow for the EDF (1:100 year 30 day event), a maximum wave height of 0.78 m with a required 0.31 of freeboard remaining.

Decanting from the pond is via fixed pumping station that supplies mill make-up water:

- 680 m^3/hr pump subject to pump availability and pond level controls, which is able to supply 59 % of the total mill make-up water demand;
- Supplies approximately 45 % of the mill make-up water annually; and
- Prior to the winter, the MRP will be drawn down to the minimum pond volume (5,000 m^3) to reduce ice losses.

If the MRP MOWL (356.8m) is exceeded, pumping into the MRP from the open pit / future underground mine will cease and pumps will pump water toward the plant site/WMP/TMA. The ECA approval requires that there will be no direct discharge from the pond to the environment.

Table 5-3; Mine Rock Pond Stage-Storage Relationship

Elevation (m)	Volume (m^3)	Notes
351.0	0.0	
352.0	3,104	
353.0	25,569	
354.0	82,650

5.4 Water Treatment

For this revision of the OMS the WDP and CW have yet to be constructed or approved for construction (LRIA and MMER Schedule 2), however information is included in this revision for completeness and will be updated prior to operation of the WMP/CW, or as specified in regulatory approvals. Ahead of any discharges this section will be updated and a contaminant release plan, consistent with MOECC requirements will be developed.

The TMA has been designed to optimize natural degradation processes to provide further water treatment, by ensuring there is sufficient retention time to allow these reactions to occur. The natural degradation processes are most effective during warm weather conditions when biophysical activity is optimal, and are also augmented by exposure to sunlight. Effluents that are planned for discharge to the environment will be held for a sufficient period of time under warm weather conditions, to maximize the effects of natural degradation. Such effluent aging will take place mainly in the summer months (June through mid-September) in both the TMA and WMP.

To optimize both water quality and river flow effects, final effluent is released to the Pinewood River at two separate locations:

- Through the constructed wetland to the Pinewood River at the Loslo Creek outflow (via lower Loslo Creek); and
- Directly to the Pinewood River just downstream of the McCallum Creek outflow, by pipeline.

The rationale for using two separate discharge locations derives from the need to achieve effective water quality treatment while minimizing adverse flow effects on the Pinewood River, under varying hydrologic operating conditions. The constructed wetland is located further

upstream on the Pinewood River pumphouse, and will help to maintain flow in the Pinewood River, however has a lower assimilative capacity. All effluent from the water management pond which is not discharged through the constructed wetland will be discharged by pipeline to the Pinewood River downstream of McCallum to take advantage of increased river assimilative capacity at this point, since wetland polishing would not be available for this portion of the discharged effluent.

The transfer of water from the TMA to the WMP (for discharge to the environment) will normally occur during the months of June through August. To facilitate this process, the water in the WMP would be drawn down by the end of May in each year. The release of WMP effluent to Pinewood River downstream of McCallum Creek outflow would occur during the spring and fall, to take advantage of extended aging in the TMA and WMP, and higher receiver assimilative capacity. Water which is not discharged from the WMP in the fall would be held over, without any further inputs from the TMA pond, until the following spring for release.

Effluent from the WMP will be discharged to the constructed wetland (as bleed flow) during all months of the year, except February and March, with more limited discharge in December and January. The bleed flow through the wetland represents the larger quantity of water that is discharged throughout the year (except in a very wet year). In low runoff years, virtually all final effluent discharge would be through the constructed wetland.

In conjunction with effluent aging and wetland treatment, final effluent quality is expected to be consistent with water quality discharge limits. Each discharge has specific discharge criteria as specified in MOECC ECA #5178-9TUPD9 which must be met prior to discharge.

5.4.1 Water Discharge Pond and Constructed Wetlands

The WDP collects runoff from natural ground catchment south of the TMA dam, seepage from the seepage collection ditch and the bleed flow from the WMP (maximum rate of 10,000 m^3/day) for discharge to the constructed wetland. The Water Discharge Pond (Drawing 3098004-004410-A1-D70-0002) will also provide erosion and sediment control south of the TMA dam.

The Constructed Wetlands are designed to provide a target of 30 days of retention time of 10,000 m3/day following discharge from the WMP into the WDP. The Constructed Wetlands are comprised of five ponds (Pond A, B, C, D, E). The downstream pond (Pond A), will contain a control structure to stop discharge to the environment in the event that water quality does not meet discharge criteria (in this case water from Pond A could be pumped back to the TMA or WMP).

5.4.2 Sediment Ponds 1 and 2

Sediment ponds are designed to provide a 12-day hydraulic retention time for all events up to and including the 25-year return period, 24-hour storm.

Sediment Pond #1 (Drawing 3098004-004430-A1-D70-0002)

- Collects runoff from the overburden stockpile;
- Will also receive additional inflow from overflow from West Creek Diversion during storm events large than the 25 year 24-hour storm event;
- The low flow outlet is designed to achieve the required retention time for the 25-year 24-hour storm event; and

- To prevent dam overtopping emergency spillway is designed for the 100-year storm event discharging to the West Creek Diversion Channel.

Sediment Pond #2 (Drawing 3098004-004440-A1-D70-0002)

- Collects runoff from the west mine rock pile (Non-Potentially Acid Generating [NPAG]) and is closer to the Pinewood River;
- The low flow outlet is designed to achieve the required retention time for the 25-year 24-hour storm event; and
- To prevent dam overtopping the high flow spillway is designed for the Regional Storm Event (Timmins storm event), discharging directly to the Pinewood River.

5.5 Freshwater Diversions

The freshwater diversion structures (dams and diversion channels) are designed to be operated passively. Clark and Teeple Ponds are full and the diversions are flowing naturally. Stockpile pond is currently filling and will flow through the stockpile diversion once the water level is above the invert to the diversion. West Creek is being allowed to slowly fill, however a terminal plug remains in place and pumps are being used to dewater the diversion.

In summer/fall 2017, the plug will be removed and the plug area will stabilise prior to water flowing through location of the former plug.

Culverts at Georgeson Lane and Marr Creek are below the design specification of the West Creek Diversion below the hydraulic control. Pending Schedule 2 approval (anticipated January 2018) these two culverts will be removed prior to freshet 2018 and the channel stabilised consistent with the design outlined in section 4.

5.6 Progressive Reclamation and Closure

Some progressive reclamation with respect to the TMA is proposed as part of mine operations. By the end of the operations phase a low permeability overburden cover of approximately 150 m in width will be placed on the upstream side of the TMA dam. The overburden cover will cover approximately two thirds of the ultimate perimeter, with the remaining approximately one third of the length to be reclaimed at closure. This cover is intended to prevent the tailings permanent water cover from coming into contact with the TMA dams, and will also serve a secondary function of limiting oxygen diffusion into the uppermost portion of the tailings underneath. The overburden cover will be seeded or hydroseeded with a native seed mix or equivalent, and will be armoured with NPAG rock at the transition zone of the cover with the tailings to prevent suspension and oxidation of solids.

Closure of the RRM in respect to tailings, process water and freshwater management will include but is not limited to the following:

- Flooding of the TMA with a 2 m or deeper water cover;
- A perimeter zone of tailings beach will be maintained to keep the central pond away from the dams, this zone will be covered with a low permeability cover;
- NPAG rock will be placed at the TMA transition zone with the tailings to prevent erosion and suspension and oxidation of solids;
- Dam structures containing the TMA have been designed with adequate safety factors to provide overall long term safety and stability;

- The water management pond dams will be breached to prevent retention of water; upstream dam faces that become exposed will be revegetated;
- The water discharge pond dam will be breached once it no longer has a water management function;
- The constructed wetland will be left in place as this system is designed to operate passively, and will have stabilized as a wetland complex during operations;
- At closure the MRP will collect runoff and seepage from the EMRS which will then be directed to the Open Pit to help flooding;
- Clark Creek Pond, West Creek Pond, Teeple Pond, Stockpile Pond, West Creek Diversion Channel, Clark Creek Diversion Channel, Teeple Pond Diversion Channel and Stockpile Pond Diversion Channel support the creation of fish habitat for compensation purposes as such they will remain in place at closure; and
- Sediment Ponds #1 and #2 will be maintained until such time as the site (or if applicable individual site components) become a recognized closed mine such that monitoring associated with the Metal Mining Effluent Regulation is no longer required, at such a time, pond impoundment structures will be breached and the residual pond sites will be stabilized and restored.

5.7 Safety and Security

The site safety and security will be following the RRM Health and Safety Management System including but not limited to the following:

- The site will be gated with restricted access to authorized personnel only;
- The TMA will be fenced along portions of the old highway 600 and access will be restricted to authorized personnel only;
- No public access;
- Construction Management provided security measures; and
- Onsite health and safety policies for working around bodies of water, working alone or crossing ice.

5.8 Environmental Protection

The Environmental Department has oversight over the EMS which contains tailings operations related environmental aspects including:

- Fugitive and point source dust emissions;
- Hydrocarbon Spills and Leaks;
- Pipeline Rupture and Leaks;
- Surface and ground water quantity and quality; and
- Wildlife management (including species at risk).

An environmental aspect register is a comprehensive inventory of tailings operations activities, environment aspects, assessment of risk and identification of controls. Tailings personnel have responsibility to implement and maintain the controls including monitoring and inspection. Refer

to the Environment Department for the environmental aspect register (in prep) and environmental related procedures.

As outlined in orientation training, it is every RRM employee's responsibility to report a suspected spill or uncontrolled release event to their supervisor. This includes suspicious flows of water out of the area, escaping tailings, etc. The sooner appropriate persons can begin to correct a situation, the less likely it is that severe impacts will follow.

Table 5-3 provides a summary of the MOECC effluent discharge limits that must be met to discharge from the WMP.

Table 5-4; MOECC Effluent Discharge Limits from the WMP

Constructed Wetland Final Discharge and Water Management Pond Pipeline Discharge (to the Pinewood River) as stated in MOECC ECA 5178-9TUPD9		
Effluent Parameter	**Daily Maximum Concentration (mg/l)**	**Monthly Average (mg/l)**
Cadmium	-	0.0010
Cobalt	-	0.0044
CBOD5	-	25.0
E.coli	-	100/100ml geometric mean density
Total Suspended Solids	30	15
Total Phosphorus	-	0.10
Cyanide (total)	0.1	0.05
Cyanide (free)	0.02	0.01
Total Arsenic	0.034	0.017
Total Copper*	0.028	0.014
Total Nickel	0.094	0.047
Total Lead*	0.030	0.015
Total Zinc*	0.348	0.174
Un-ionized Ammonia	0.08	0.04
Acute Toxicity (Rainbow Trout and Daphnia Magna)	Non-acutely lethal (not greater than 50% mortality in undiluted effluent)	
pH of the effluent maintained between 6.0 to 9.5, inclusive, at all times		

Notes:

1. *Proposed effluent criteria for Total Copper, Total Lead, and Total Zinc are based on a hardness of 200 mg/L CaCO3. In the event that water quality sampling indicates that 75th percentile hardness concentrations are less than 200 mg/L CaCO3, the effluent limits may be changed by the District Manager in writing, consistent with achieving no impairment for receiving waters.
2. Additional effluent limits for sediments 1&2 are stated in MOECC ECA 5178-9TUPD9
3. The effluent discharge rate from the Constructed Wetland Final Discharge and the Water Management Pond Pipeline Discharge such that at all times the ratio of the combined flow rate of these effluents to the flow rate of the receiving surface water (Pinewood River) is less than or equal to 1:1 (i.e. the cumulative flow rate of the effluent must be less than or equal to the flow rate of the receiving surface water).
4. Prior to commencing Operations Phase discharges (Constructed Wetland Final Discharge, Water Management Pond Pipeline Discharge, Sediment Pond #1, and Sediment Pond #2), the method for determining daily effluent to receiver flow mixing ratios shall be approved by the District Manager.
5. For sampling frequencies and full parameter list refer to MOECC ECA 5178-9TUPD9; sampling frequency varies from thrice weekly to quarterly depending on the parameter

5.9 Reporting Requirements

An Operations Report will be prepared by the Mill Manager or designate. The report will include metrics and information collected as part of normal operation. Examples of information contained in the Operations report include:

- Total monthly tailings deposition tonnage and slurry water volume;
- Total monthly reclaim volume;
- Pond level and freeboard;
- Updated water balance;
- Water quality results; and
- Intake / Discharge quantities.

Each of the regulatory approval requirements related to the construction, operation and eventual reclamation of the Site have specific compliance reporting requirements with defined deadlines or reporting periodicity. In general, the reporting includes:

- Operation, Maintenance and Surveillance Plan(s) for dams, water management (water quality) and air/noise emissions;
- Emergency Preparedness Plan(s);
- As-Built Drawings and related Construction Reports;
- Dam Safety Inspection and Review Reports
- Environmental Monitoring Plans; and
- Environmental Monitoring and Performance Reports.

The environmental approvals and permits received from the government that are maintained by the New Gold Environmental Department should be referred to for details of monitoring, inspection and reporting requirements.

In addition, the New Gold Environmental Department should be notified of any proposed major modification to RRM facilities, in order that they can liaise with the appropriate government ministries to determine if additional approvals or amendments to existing approvals are required.

6.0 MAINTENANCE

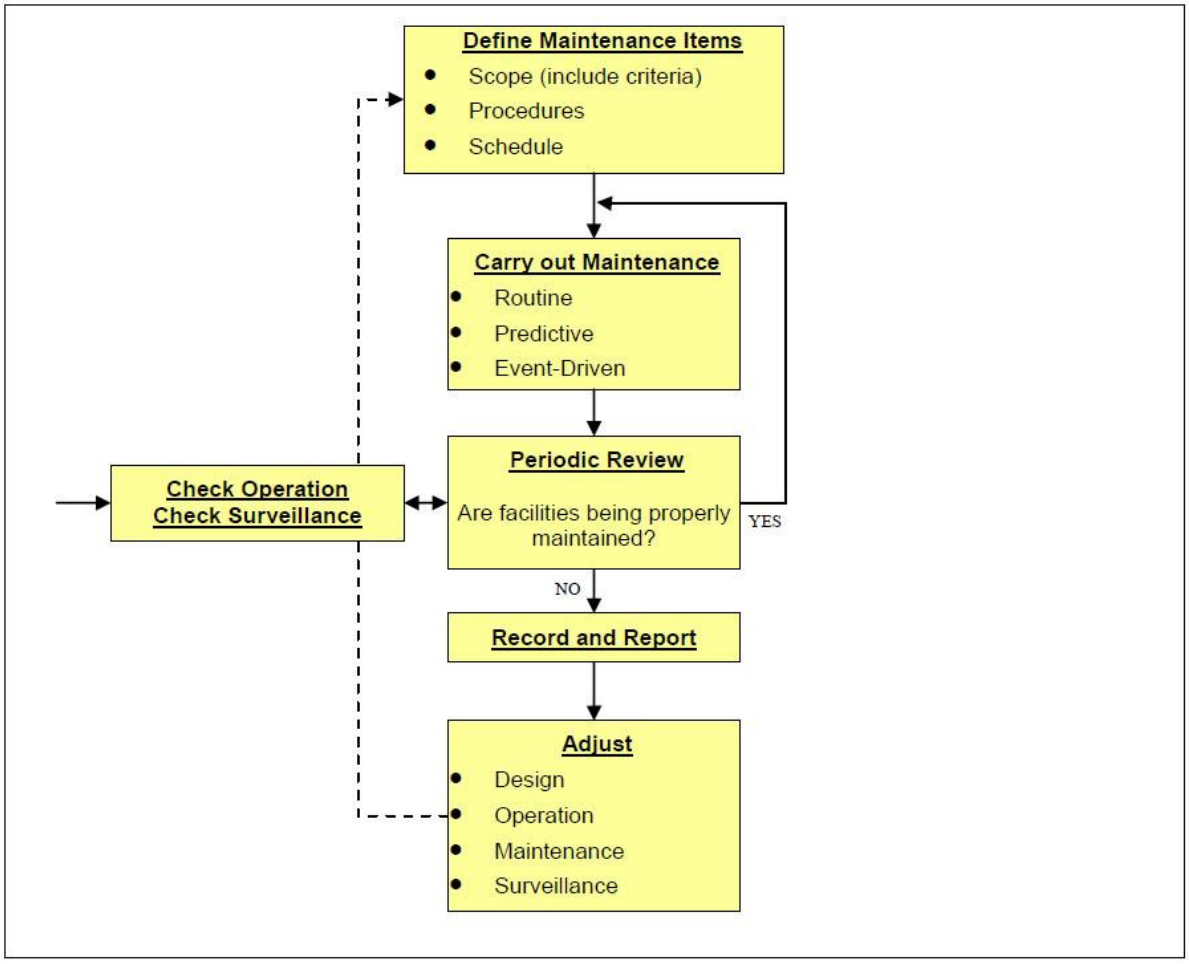
The following periodic maintenance is required:

1. Maintain the tailings and reclaim pumps and associated lines and containment;
2. Clear debris, snow and ice which may block flow from through the decant facility or emergency spillways;
3. Maintain water management structures including spillways, ditches and diversions;
4. Maintain equipment, power and water lines, and instrumentation;
5. Repair any deficiencies as noted in the Dam Safety Inspections (DSI); and
6. Reconstruct the support for tailings discharge pipelines wherever washouts occur.

Maintenance records are retained by maintenance personnel performing the work in accordance with the procedures described in this document. Timing of maintenance actions for unusual conditions should be based on specific recommendations from surveillance findings. Scope and time frames for routine maintenance activities are determined and scheduled by the Maintenance Department and based on manufacturer's recommendations and best practices.

The maintenance flowchart is illustrated in Figure 6-1.

Figure 6-1; Maintenance Flow Chart



6.1 Routine and Predictive Maintenance

Routine and predictive maintenance includes removal of vegetation, beaver dams, ice blockage or sediment accumulation that would otherwise affect the performance of a structure when required.

6.1.1 Dams

The following are examples of specific maintenance activities:

- Regularly check diversion ditches, spillways and culverts for accumulation of debris or sediment, or any other form of blockage including ice, and remove if required;
- Visually inspect diversions, spillways, seepage collection sumps, dams and all ditches for cracking, bulging, slumping, and any other indications of slope movement (note, any indications of slope movement shall be reported to a qualified geotechnical engineer);

- Re-grade the dam crest, as required, to prevent local ponding and direct surface runoff towards the pond;
- Repair erosion gullies, local slumps or slides in the dam face, diversion ditches or spillway channels; and
- Regularly check diversion ditches for accumulation of debris or sediment, or any other forms of blockage, and remove if required.
- If annual survey determines necessary, correct dam crest, overflow spill way and diversion channel invert irregularities to avoid concentrated runoff.

6.1.2 Ditches and spillways

Ditch maintenance includes replacement or enhancement of erosion protection to prevent sediment generation or sloughing of slopes, as required.

6.1.3 Diversions

There are approximately 10 km of diversions associated with the Clark and West Creek diversion. Maintenance activities required include;

- Repair erosion and bank stability particularly in areas of concentrated flow e.g., culverts;
- Remove debris, and where required and approved beaver dams, that aren't part of natural progression of channel development
- Repair/modify fish habitat features if monitoring determines they are not meeting the success criteria per Fisheries Act Authorization 15-HCAA-00039, including dam crest/slope

Specifically, for the Clark Creek diversion, as per the as built report, the following maintenance will be conducted;

- Repair riffles in the Teeple Road Diversion, directly downstream of the inlet in fall 2017.

6.1.4 Geotechnical and Water Monitoring Instrumentation

Instrumentation is calibrated by the manufacturer prior to shipment. Calibration certificates will be maintained by maintenance department. Following instrument installation, initial reading procedures will be followed. Subsequent calibration will follow manufacturers recommendations.

Malfunctioning or damaged instruments may require repair or replacement per manufacturer guidelines or approved procedure. In the event of replacement of dam instrumentation, several overlapping readings of the old and new instrument are required to ensure continuity of the data records.

6.1.5 Pumping Systems and Pipelines

Maintenance of the tailing delivery, water recirculation systems and seepage pumps will include:

- Perform regular performance tests of the Pinewood Pumphouse pumps and inspections of pump fish screens to remove any debris;
- Perform regular performance tests on seepage pond pumps
- Perform annual calibration and maintenance as required on flow meters;

- Perform regular non-destructive testing appropriate for components of the tailings delivery system, including for example, periodic measurement of pipeline thickness to identify areas of wear and to schedule pipeline replacement if necessary and repair liners as required;
- Replace pipe work, bends and fitting components as required;
- Remove accumulated debris from valves, reducers and off takes;
- Carry out maintenance as recommended by fitting and valve suppliers;
- Regularly inspect major wear components;
- Maintain emergency dump ponds in a dewatered/empty state; and
- Maintain and replace system instrumentation as required.

6.1.6 Mobile Equipment

Mobile equipment is maintained on the basis of a planned reliability program and as otherwise required. Equipment in question includes:

- Dozers;
- Excavators;
- Water truck;
- Pickup trucks;
- Mobile crane;
- Flatbed and picker truck; and
- Replacement of mobile equipment as required.

6.2 Event-Driven Maintenance

In the event of unusual conditions or incidents that require immediate maintenance actions but are not considered an emergency, repairs and replacement of facility components are made as required and activities are documented. RRM staff will provide a means to assess event driven maintenance needs through response action planning. Response planning is based on risk prioritization, maintenance crew mobilization or “call out” procedures, required repairs and replacement material availability. Event driven maintenance actions will follow applicable safety and performance procedures. Normal documentation and maintenance records will be maintained as a result of any event driven maintenance actions. Unusual conditions that require maintenance are also communicated to maintenance staff as they occur.

6.2.1 Pipeline Leaks or Breaks

In the event of a pipeline leak or break the system in question is de-energized and repaired as follows:

- Inspect entire pipeline;
- Repair or replace affected components;
- Perform opportune and scheduled maintenance;
- Repair any collateral damage caused by a leak or break;

- Collect any released tailings and place in the tailings impoundment;
- Reclaim any disturbed areas; and
- Follow any spill reporting that may be required pending type of spill and following documentation procedures.

6.2.2 Earthquake Occurrence

Following an earthquake, the following are undertaken:

- Inspect dam and beach areas for sign of distress due to deformation;
- Inspect dam for signs of liquefaction (e.g., local sand boils, etc.);
- Measure freeboard for compliance with design requirements;
- Inspect toe area of dam for signs of deformation or piping of fines;
- Inspect diversions, ditches and spillways for sign of slumping or changes in geometry;
- Inspect seepage collection areas; and
- Collect instrumentation data and submit to EOR for analysis.

6.2.3 Flood Event

Following extreme storms (as defined in section 7) the following are undertaken:

- Measure freeboard for compliance with design requirements;
- Inspect dam, diversions, ditches, spillways and diversions for signs of excessive erosion and repair if required;
- Inspect seepage return system for adequacy; and
- Implement appropriate response based on observations/measurements as defined in this manual.

6.3 Reporting Requirements

Maintenance information will be communicated internally through formal and informal meetings, interaction between various levels of the organization (department and/or crew meetings), through information posted at the site and through this OMS Manual.

Communications with applicable contractors involved in tailings management will be conducted daily and weekly during tailings activity meetings, as appropriate. All employees and contractors are encouraged to communicate openly with site management about operational conditions requiring maintenance and reporting any significant observations such as event-driven maintenance or any maintenance requirements that exceed expected norms.

Equipment logs and manuals will be maintained for reference and use by responsible staff.

Maintenance diaries and logs shall be maintained and accessible for review by other parties.

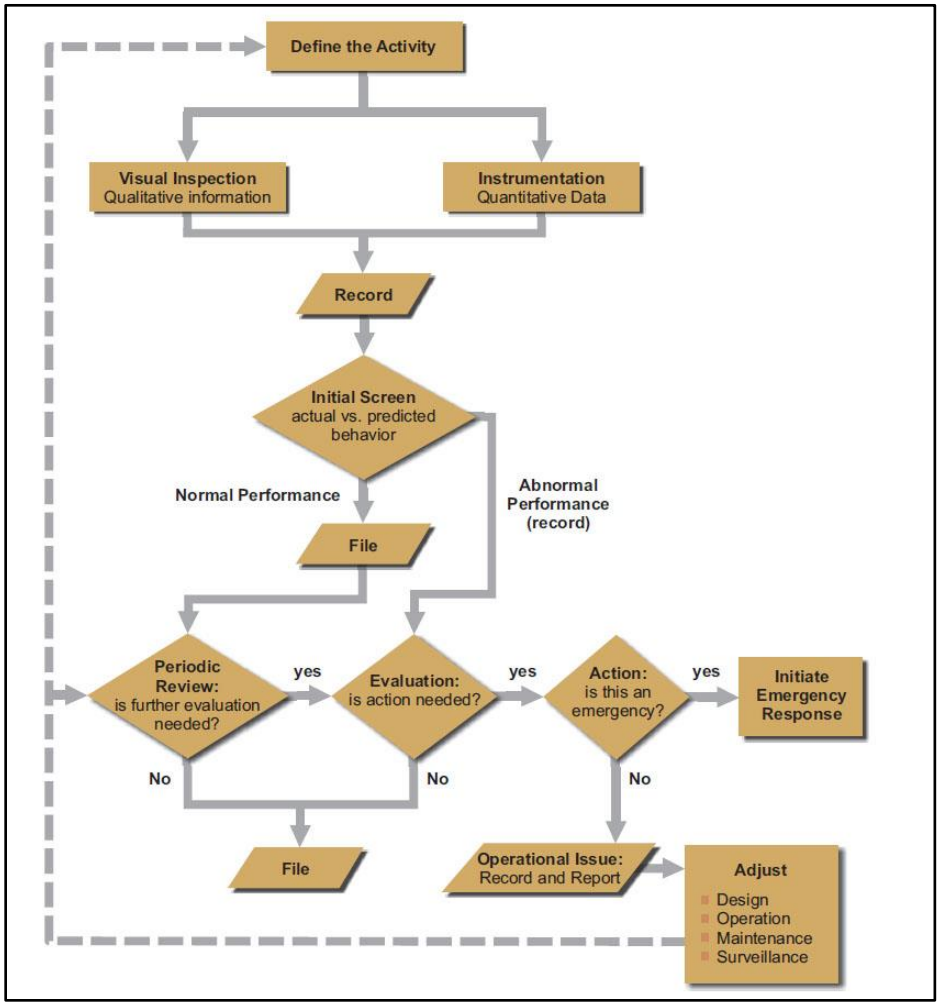
7.0 DAM SAFETY AND SURVEILLANCE

The RRM tailings and water management surveillance activities involve inspection and monitoring of the operation, structural integrity and safety of a facility. Regular review of surveillance information can provide an early indication of performance trends that, although within specifications, warrant further evaluation or action. The objectives of our surveillance program are as follows:

- Monitoring the operation, safety and environmental performance of tailings and water management facilities;
- Promptly identifying and evaluating deviations from expected behavior that affect operational safety, structural integrity and environmental performance of the facility; and
- Reporting significant observations for response.

The flow chat for surveillance is shown in Figure 7-1. Surveillance is undertaken in two primary methods – visual inspection and reading of instruments. Results of these qualitative and quantitative observations are compared to the expected performance of the TMA and water management facilities. If observations are within the expected range or performance, the results of the surveillance are simply recorded. If observations are outside the expected range, further evaluation is completed to determine if remedial action is necessary. If necessary, this action is taken and may range from a minor adjustment to operational procedures to initiation of emergency response, depending on the severity and nature of the deviation from expected performance.

Figure 7-1; Surveillance Flow Chart



7.1 Surveillance and Inspections by Mine, Mill and Environment Operations Staff

The purpose of the surveillance program is to identify and classify problems and/or unsafe conditions that are visually evident. Visual inspections are an integral part of proper maintenance and performance of monitoring programs for the TMA and water management facilities. Failure to correct identified maintenance and repair items, or potential adverse behaviour, could result in unsafe conditions or lead to a failure of operating systems or cause an adverse environmental effect.

The surveillance program will consist of making regular observations relating to:

- The conditions and performance of the dams including indications of cracking, bulging, depressions, sinkholes, vegetation, surface erosion and seepage;
- Water levels and pump intake zones;
- Function of ancillary hydraulic structures (diversions, spillways, pipelines etc.);
- Discharge pipeline operations and tailings beach development; and

- Total facility performance.

During inspections, observations will be made at the upstream slope, crest and downstream slope with respect to signs of erosion, scouring, cracking, settlement, deformation, and any instability and abnormality. Seepage rates will be visually estimated and recorded on the inspection forms. Changes in the seepage rate or clarity (i.e., turbidity) require immediate reporting to the Engineer-of-Record.

7.1.1 Daily Inspections

During first filling of all dams except the TMA dams Surveillance records will be maintained in logs at site and submitted to the EOR for review daily and on a monthly basis thereafter, or more frequently as warranted. Any abnormal behaviour including slope slumping, erosion of crest settlement will be reported immediately to the Engineer-of-Record.

Routine daily visual inspections of critical dams (TMA, WMP and MRP), spillways, pipelines, pipeline containment and pumping infrastructure will be carried out on an on-going basis to confirm normal operations and identify unusual or anomalous conditions such as pipeline leaks, pump intake blockages, etc. All active pipelines will be inspected twice per 12 h shift, consistent with EA conditions.

Daily inspection sheets and provided in Appendix F.

7.1.2 Weekly Inspections

Physical inspections of the TMA, process water, water treatment and diversion dams will be conducted on a weekly basis. The weekly inspections will include those discussed in Section 7.1.1 and the following tasks:

- Photographic record of key features;
- Physical inspection of dams, dykes, diversion, ditches and spillways:
    - Indicating and reporting any seepage and erosion.
- Pond levels and freeboard:
    - Additional monitoring maybe required during spring freshet of the dams.

Weekly inspection sheets and SOPs are provided in Appendix F. All weekly inspections will be documented in a report and will be compiled as part of the annual DSI (Section 7.4).

7.1.3 Other Inspections

7.1.3.1 Diversions

The Clark and West Creek diversions, while designed to operate passively, have specific surveillance requirements as part of the approved Fisheries Act authorizations. Further, impediments to water flow in diversions have the potential to alter water levels in the ponds. For the diversions, in addition to requirements specified above, and following the as built report for the Clark Creek Diversion these surveillance requirements will be conducted;

- Inspection of fish habitat features, as per Fisheries Act Authorization 15-HCAA-00039;
- Complete a survey of the Clark and Teeple dam crests and diversion channel inverts annually, observations of crest irregularity will require correction to avoid concentrated runoff in the overflow spillway;

- Monitoring pond levels include Teeple and Stockpile ponds (by staff gauge, transducer or other suitable means) daily. The frequency will be re-evaluated after one year of operation (May 2018).

7.1.3.2 Water Treatment

The water treatment facilities, WDP, CW and sediment ponds 1 and 2 will be inspected consistent with LRIA approvals (pending) and the MOECC ECA approval. This section will be updated in future revisions, to describe surveillance requirements in addition to those outlined above which may include;

- Discharge pipeline and mixing structure;
- Up to thrice weekly water quality sampling from discharge points; and
- Inspections to confirm the absence of oil/sheen.

7.2 Inspection Required After an Unusual Event

Several potential failure modes exist for the various tailings and water management and water diversion storage facilities. These potential failure modes, along with likely triggers, observable visual and instrumentation indicators of the failure mode are presented in Table 9-1. Special inspections will be carried out immediately if any of the following events occur:

- Events such as an earthquake, large rainfall (greater than 1:2 year rainfall (51mm)) or large snowfall/snowpack;
- Operating events such as rupture of a pipeline, particularly if on the slope or crest of the dam, sudden loss of pond water, sudden rapid rise of pond water;
- Observations such as cracks, excessive settlements, sinkholes, large slope or foundation deformations, increased seepage, turbidity of seepage water; and
- Instrument readings that deviate from historical trends, or are within “alert” action levels (e.g., trigger levels).

Special inspections after unusual events are necessary as summarized in Tables 7-1 to evaluate whether there has been any damage requiring correction, any safety measures or special operating procedures that need to be implemented, or if there is a need to initiate emergency procedures as described in Section 9.0.

Table 7-1; Maintenance Requirements following an Unusual Event

Unusual Event	Post – Event Inspection/Surveillance
Earthquakes	Carry out a detailed walkover of all dam structures, including crests, downstream and upstream (visible) slopes and dam toes, and all spillways, looking for signs of cracks, bulging, settlement and/or other deformations. Look for and note any changes in seepage, particularly with respect to the rate of seepage flows at dam slopes and seepage clarity. Read all piezometers. Inspect downstream toes of dams for sand boils and dam slopes for sinkholes. Inspect ponds upstream of the dams looking for 'whirlpools'. Inspect all pump stations and pipelines. Discuss findings with the Dam Safety Inspector.
Rapid snowmelt and/or heavy rainstorms exceeding a 1:2 year rainfall (51 mm)	Inspect the (visible) slopes and the crests of all the tailings dams looking for areas of concentrated runoff and erosion. Make note of saturated ground/soft ground conditions at dam slopes and toes. Examine dam slopes for indications of localized slumping/instability. Inspect all pump stations and pipelines. Check the water levels in all ponds/reservoirs against the critical levels, and keep checking these levels until the pond/reservoir inflows subside. Discuss findings with the Dam Safety Inspector. Check piezometric levels at dam sites if instructed to do so.
Unusually high winds (exceeding 60 kph i.e., 75 % of maximum likely used in design)	Check the condition of erosion protection on the upstream slopes of the dams.
Extreme snow pack (170cm cumulative snowfall) (i.e., 120% or greater than normal snowfall at Barwick)	Check the water levels in all ponds/reservoirs against the critical levels, and keep checking these levels until the spring freshet is over. Evaluate the situation in terms of possible snowmelt scenarios. Make predictions as to the expected storage capacity available in ponds/reservoirs. If deemed necessary, mobilize pumping and mobile treatment equipment to site.
Significant, relatively rapid erosion (any cause) of dam slope of 'sudden' seepage break at dam slope or downstream of dam in form of continuous seepage or boils	Inspect clarity of seepage, rate of seepage and amount of material sloughed. Notify tailings coordinator – site engineering and EOR. Consider initiating Emergency Response Plan
Pond level close to, or approaching a critical level	Notify Manager. Consider initiating Emergency Response Plan
Significant change in an instrumentation reading – see table below for definition of significant change	Check the historical readings paying special attention to seasonal changes and check the measurement again. Carry out visual inspection of all areas in the vicinity of the instrument of interest. Contact the Engineer of Record.

7.3 Dam Instrumentation and Monitoring

The instrumentation data is reviewed regularly to identify anomalous readings that could indicate a change in the conditions of the tailings and water management facilities. Dam instrumentation lists are provided in section 4.6. Instrumentation reading and reporting frequencies are outlined in Table 7.2. Responsible parties' record notes and takes pictures of any potential anomalies to provide further information to the EOR. Instrument trigger and alert levels are provided in Table

7.3. Additional details on instrument reading frequencies can be found in the *Geotechnical Monitoring Plan* (Amec Foster Wheeler, 2016b).

Piezometers:

- Vibrating Wire Piezometers shall have a reading frequency every hour and recorded by a data logger, with data collected daily during construction. Post-construction after the readings have stabilized, the reading frequency will be reduced to every 12 hours, as defined in the table below;
- Standpipe piezometers shall be measured weekly during construction and monthly following construction;
- The following are considered anomalous:
    - Sudden increases or decreases that do not correlate with seasonal variations (e.g., groundwater recharge during snowmelt affecting foundation piezometers);
    - Trend of piezometric increase that approaches or exceeds the rate of rise of the tailings pond; and
    - Pattern of sudden and large increases followed by rapid declines.

Inclinometers:

- Inclinometers shall be monitored semi-weekly during construction and monthly following construction;
- Anomalous data includes:
    - Sudden increases in cumulative displacement/rate of movement of the inclinometers;
    - Zones of concentrated or discrete displacement; and
    - Blockages of the inclinometer casing.

Settlement Plates and Survey Pins/Monuments:

- Settlement Plates and Survey Pins/Monuments shall have a reading frequency of semi-weekly during construction and monthly following construction;
- Anomalous data includes:
    - Sudden displacements of the settlement monuments (x, y, z directions); and
    - Accelerating displacement trends (over two or more readings).

If anomalous readings are observed, the following actions should be taken:

- Check data, reductions and calculations for accuracy and correctness;
- If no errors are found in the calculations, notify the EOR, Geotechnical Engineer and Environmental Manager that an anomalous reading has been observed and that further assessment is going to be conducted;
- Check readout equipment to verify that it is functioning correctly; verify calibration;
- Re-read all instrumentation of the type for which the anomalous reading was observed, in order to check the reading and reading in adjacent instruments;

- If it is observed that an instrument or piece of readout equipment has stopped functioning, notify the Mill Manager and/or Superintendent, and the EOR immediately. If considered critical, a replacement instrument should be installed;
- If the anomalous reading is confirmed, notify the Superintendent and EOR immediately; and
- A detailed review of the effects of the reading should be carried out and the monitoring frequency of the instruments in the area of the anomaly increased to assess the progression of the anomaly. Design or remedial actions should be implemented if determined necessary.

All results are downloaded and provided to the EOR. Any anomalies are noted and a request for an additional reading may occur. The EOR will review the data in quarterly monitoring reports, and make any recommendations, such as increased reading frequencies, pertaining to anomalous readings. The EOR, will also assess the trigger and alert levels and update them as necessary, once per year, as part of the DSI.

Table 7-2; Dam Instrumentation Surveillance Requirements

Type	Frequency
Routine Inspection:	
Dam	Weekly
Diversions	Weekly
Ditches	Weekly
Seepage collection system	Weekly
Spillways	Weekly
Pipelines	Twice per 12 h shift – per EA commitments
Tailings Pond Monitoring:	Weekly
Pump intake	Weekly
Staff gauges	Weekly (initially every ~12h) in Cell 1 borrow
Inflows, Outflows, Condition	Monthly
Dam Instrumentation:	Monthly
TMA, WMP and MRP Comprehensive (and water diversions during initial filling)	• Daily during construction and initial filling • Weekly, during initial operations depending on trend • Monthly during routine operation
Annual Dam Inspection	Annually, with no snow cover
Event Driven Inspection	Following unusual events (defined in table 7.1)
Comprehensive Review (DSR):	
Low and Moderate HPC dams	Every 10 years and prior to decommissioning
Very High HPC dams	Every 5 years and prior to decommissioning

Notes:

1. Dam Hazard Potential Classification (HPC) requires review when changes are made or downstream conditions change.
2. Monthly facility inspections should be carried out by the same staff or small group of staff such that subtle changes in the conditions can be detected.

Table 7-3; Instrument Trigger and Alert Levels

Instrument	Parameter	Trigger Level	Alert Level	Remarks
VWP/STP	Pore Pressure Ratio	r_u = 0.4	r_u = 0.5	Pore pressure data to be evaluated with corresponding fill elevation, and monitored movements at SPs and INs
Survey Pin	Lateral Movement Rate	Uniform (but less than max 75 mm magnitude)	Accelerating	To be evaluated with IN data to define zones of movement
Slope Inclinometer	Lateral Movement Rate	Uniform	Accelerating	Deformation rates will be associated with rate of construction and post construction movements
	Share Strain Magnitude	2%	5%	If specific plane(s) of shearing is observed within the foundation, the construction shall be limited, progressed with caution or ceased depending on the observed phenomena

Notes:
1. r_u of 0.4 corresponds to a piezometric head at 80% of the dam height. r_u 0.5 is at pietometric head at the crest of the dam.
2. r_u of 0.5 is a design criteria to meet dam stability requirements.

Source; Geotechnical Monitoring Plan (AMECFW, August 2016)

7.4 Dam Safety Inspections (DSIs) and Dam Safety Reviews (DSRs)

Consistent with MOECC ECA approvals, with the regulatory exception of the Clark and West Creek Diversions, engineering inspections will be conduct following best management practices as per the Canadian Dam Association's (CDA) Dam Safety Guidelines (2007, revised 2013, as amended from time to time), and the 2014 CDA Technical Bulletin: Application of Dam Safety Guidelines to Mining Dams (as amended from time to time).

7.4.1 Dam Safety Inspections

Annual inspections are intended to be part of a more thorough review of the condition of the facility, and are carried out by the EOR. The inspections will include the following key items:

- Visual inspection of the facility by the engineer, including taking appropriate photographs of the observed conditions;
- Review of routine inspection records prepared by operating personnel in the past year;
- Review whether or not recommendations from previous year's inspection(s) have been addressed, and any incidents or actions arising from those previous recommendations;
- Review of instrumentation and monitoring data;
- Review of tailings deposition and water management operations of the facility including reconciliation of the annual water and mass balance. Review of pond levels (and depth) and freeboard, and reports of any incidents (and remedial measures) that may have occurred;

- An evaluation and interpretation of the structural performance of the dam and related components, and identify any potential safety deficiencies or recommended items that need to be addressed in the coming year;
- Review construction records, QA/QC data and as-built information on dam construction and beaching; and
- Evaluation of the OMS Manual to assess the need for updating.

The results of the inspection and review will be documented in a report.

7.4.2 Dam Safety Review

The Canadian Dam Association (CDA) Dam Safety Guidelines (CDA, 2007) recommend a comprehensive dam safety review be carried out every 5 years during operations, prior to decommissioning and following closure, by a qualified 3rd party consultant.

The comprehensive review provides independent verification of:

- Safety and environmental performance of the facility;
- Adequacy of the surveillance program;
- Adequacy of delivery of OMS Manual requirements;
- Design basis with respect to current standards and possible failure modes; and
- Compliance with new engineering standards (including analysis to confirm if necessary).

7.5 Documentation

Documentation of surveillance and monitoring activities shall be maintained by the Mill Manger, or as designated, as described in the preceding sections and will include recording of:

- Routine visual observations (departures from normal conditions);
- Photographs;
- Instrumentation monitoring and testing;
- Analyses and evaluations; and
- Reviews.

Documentation will include, as a minimum, the following:

- Weekly routine inspection log;
- Monthly tailings facility and process water pond monitoring report;
- Quarterly instrumentation reports;
- Annual Dam Safety Inspection reports; and
- Comprehensive Dam Safety Review report every 5 years.

Documentation will include a hard copy (paper) and electronic filing system for inspection reports, photographic and video records, incident reports, instrumentation readings, instrumentation plots, annual inspections and third-party reviews, so that they can be quickly retrieved for review and in case of an emergency.

7.6 Reporting

The Mill Manager, or designated responsible party, and Geotechnical Engineer will review collected data records from facility monitoring and assess the need for maintenance activities or response. Corrective actions will be identified and tracked to closure. The Environmental Manager is responsible for overseeing sample and data collection and analysis. Reporting will meet MOECC requirements and the annual DSI report will also be submitted to the MRNF. Reporting includes;

- As built reports of the dams, excluding the Clark and West Creek diversions, will be submitted to MOECC within 90 days of completion;
- An annual report based on the DSI including ECA approval requirements;
- Monthly water quality monitoring report; and
- Annual report including any operating problems and corrective actions, a summary of calibration and maintenance works, use of contingency plans, surface water and groundwater monitoring reports including water balance, ML/ARD updates, discharge volumes and quality.

Additional reporting requirements may be developed as the RRM progresses.

8.0 CLOSURE PLAN

This section summarizes the objectives of the Closure Plan. The *Rainy River Project – Closure Plan* (Amec Foster Wheeler, 2015c) provides the closure plan and includes temporary closure options for short and medium-term shut-down of site facilities.

8.1 Tailings Management Area

Closure of the TMA will include, but is not limited to, the following:

- Flooding of the TMA with a 2 m or deeper water cover;
- A perimeter zone of tailings beach will be maintained to keep the central pond away from the dams, this zone will be covered with a low permeability cover;
- NPAG rock will be placed at the TMA transition zone with the tailings to prevent erosion and suspension and oxidation of solids; and
- Dam structures containing the TMA have been designed with adequate safety factors to provide overall long term safety and stability.

8.2 Embankments

Closure of the embankments will typically involve, but is not limited to reaching of embankments to prevent ponding of water and revegetating slopes to reclaim the area. Some embankment

structures will still have a role during the closure phase and these will not be breached. The following structures will continue to be operated during the closure phase:

- MRP will collect runoff and seepage from EMRS, which will be directed to the Open Pit to help flooding;
- Sediment Ponds #1 and #2 will be maintained until site is recognized as a closed mine and monitoring associated with the Metal Mining Effluent Regulation is no longer required

Freshwater diversion and constructed wetland structures are designed to operate passively and will remain in place at closure.

8.3 Monitoring

Monitoring requirements are described in the *Rainy River Project – Closure Plan* (Amec Foster Wheeler, 2017c).

9.0 EMERGENCY PREPAREDNESS

The objectives of this section is to describe procedures to prevent the occurrence of emergencies and reduce the impact, should they arise. This manual covers only those emergency situations that could potentially pose a threat to the structural integrity of the dams or result in the release of tailings and/or supernatant pond water into the surrounding environment. This document was developed to work in conjunction with the Emergency Preparedness and Response Plan (EPRP) (as reviewed annually and maintained by New Gold H&S team – latest revision February 2017).

The ultimate goal is to protect human life and health, the social well-being of the local community and employees, public infrastructure and company facilities; and environmental conditions and habitats.

9.1 Definition and Classification of Emergencies

An emergency is defined as:

> *"A situation or a set of circumstances which, if not promptly eliminated, controlled or contained, results or could result in a significant injury to people (including the community) and/or damage to the tailings facility, property and/or the environment."*

9.2 Potential Dam Failure Modes

The containment dams at the RRM are predominately zoned embankments with clay cores and rock fill shells. The primary method of dam construction uses the centreline method which is considered to be a stable form of construction. Adherence to design drawings and specifications is critical to minimize the risk of failure.

Several potential failure modes exist for the various tailings storage and water management facilities. These potential failure modes, along with likely triggers, observable visual and instrumentation indicators of the failure mode are presented in Table 9-1. A preliminary dam break inundation map is provided in Figure 9-1.

External hazards originate outside the boundary of the dam and reservoir system and are beyond the control of the dam owner. External hazards include the following:

- Meteorological events, such as floods, intense rainstorms (causing local erosion or landslides), temperature extremes, ice, lightning strikes, and windstorms;
- Seismic events, either natural, cause by economic activity such as mining, or even reservoir induced;
- The reservoir environment, including rim features, such as upstream dams and slopes around the reservoir that pose a threat; and
- Vandalism and security threats.

Internal hazards may arise from the ageing process or from errors and omissions in the design, construction, operation, and maintenance of the dam and water conveyance structures. Internal hazards can be subdivided by source:

- Components that retain or interfere with the body of water;
- Water conveyance structures required to direct water around or through the dam in a controlled way;
- Mechanical, electrical, and control subsystems;

- Infrastructure and plans, including instruments, operating orders, maintenance strategies and procedures, surveillance procedures, and emergency plans, as well as inflow forecasts.

A failure mode describes how a component failure occurs to cause loss of the system function. Failure modes may be interdependent and change in nature and significance at different stages of a dam's life. In any analysis, the failure characteristics, including extent and rate of development, should be determined to an appropriate level of detail. At a general level, there are three dam failure modes:

- Overtopping – water flows over the crest of the dam, contrary to design intent;
- Collapse – internal resistance to the applied forces is inadequate; and
- Contaminated seepage – contaminated fluid escapes to the natural environment.

Dam safety risk management is directed to (1) prevention of the initiation of a failure sequence; (2) control of a deteriorating situation, and (3) mitigation of situations where the failure sequence cannot be stopped.

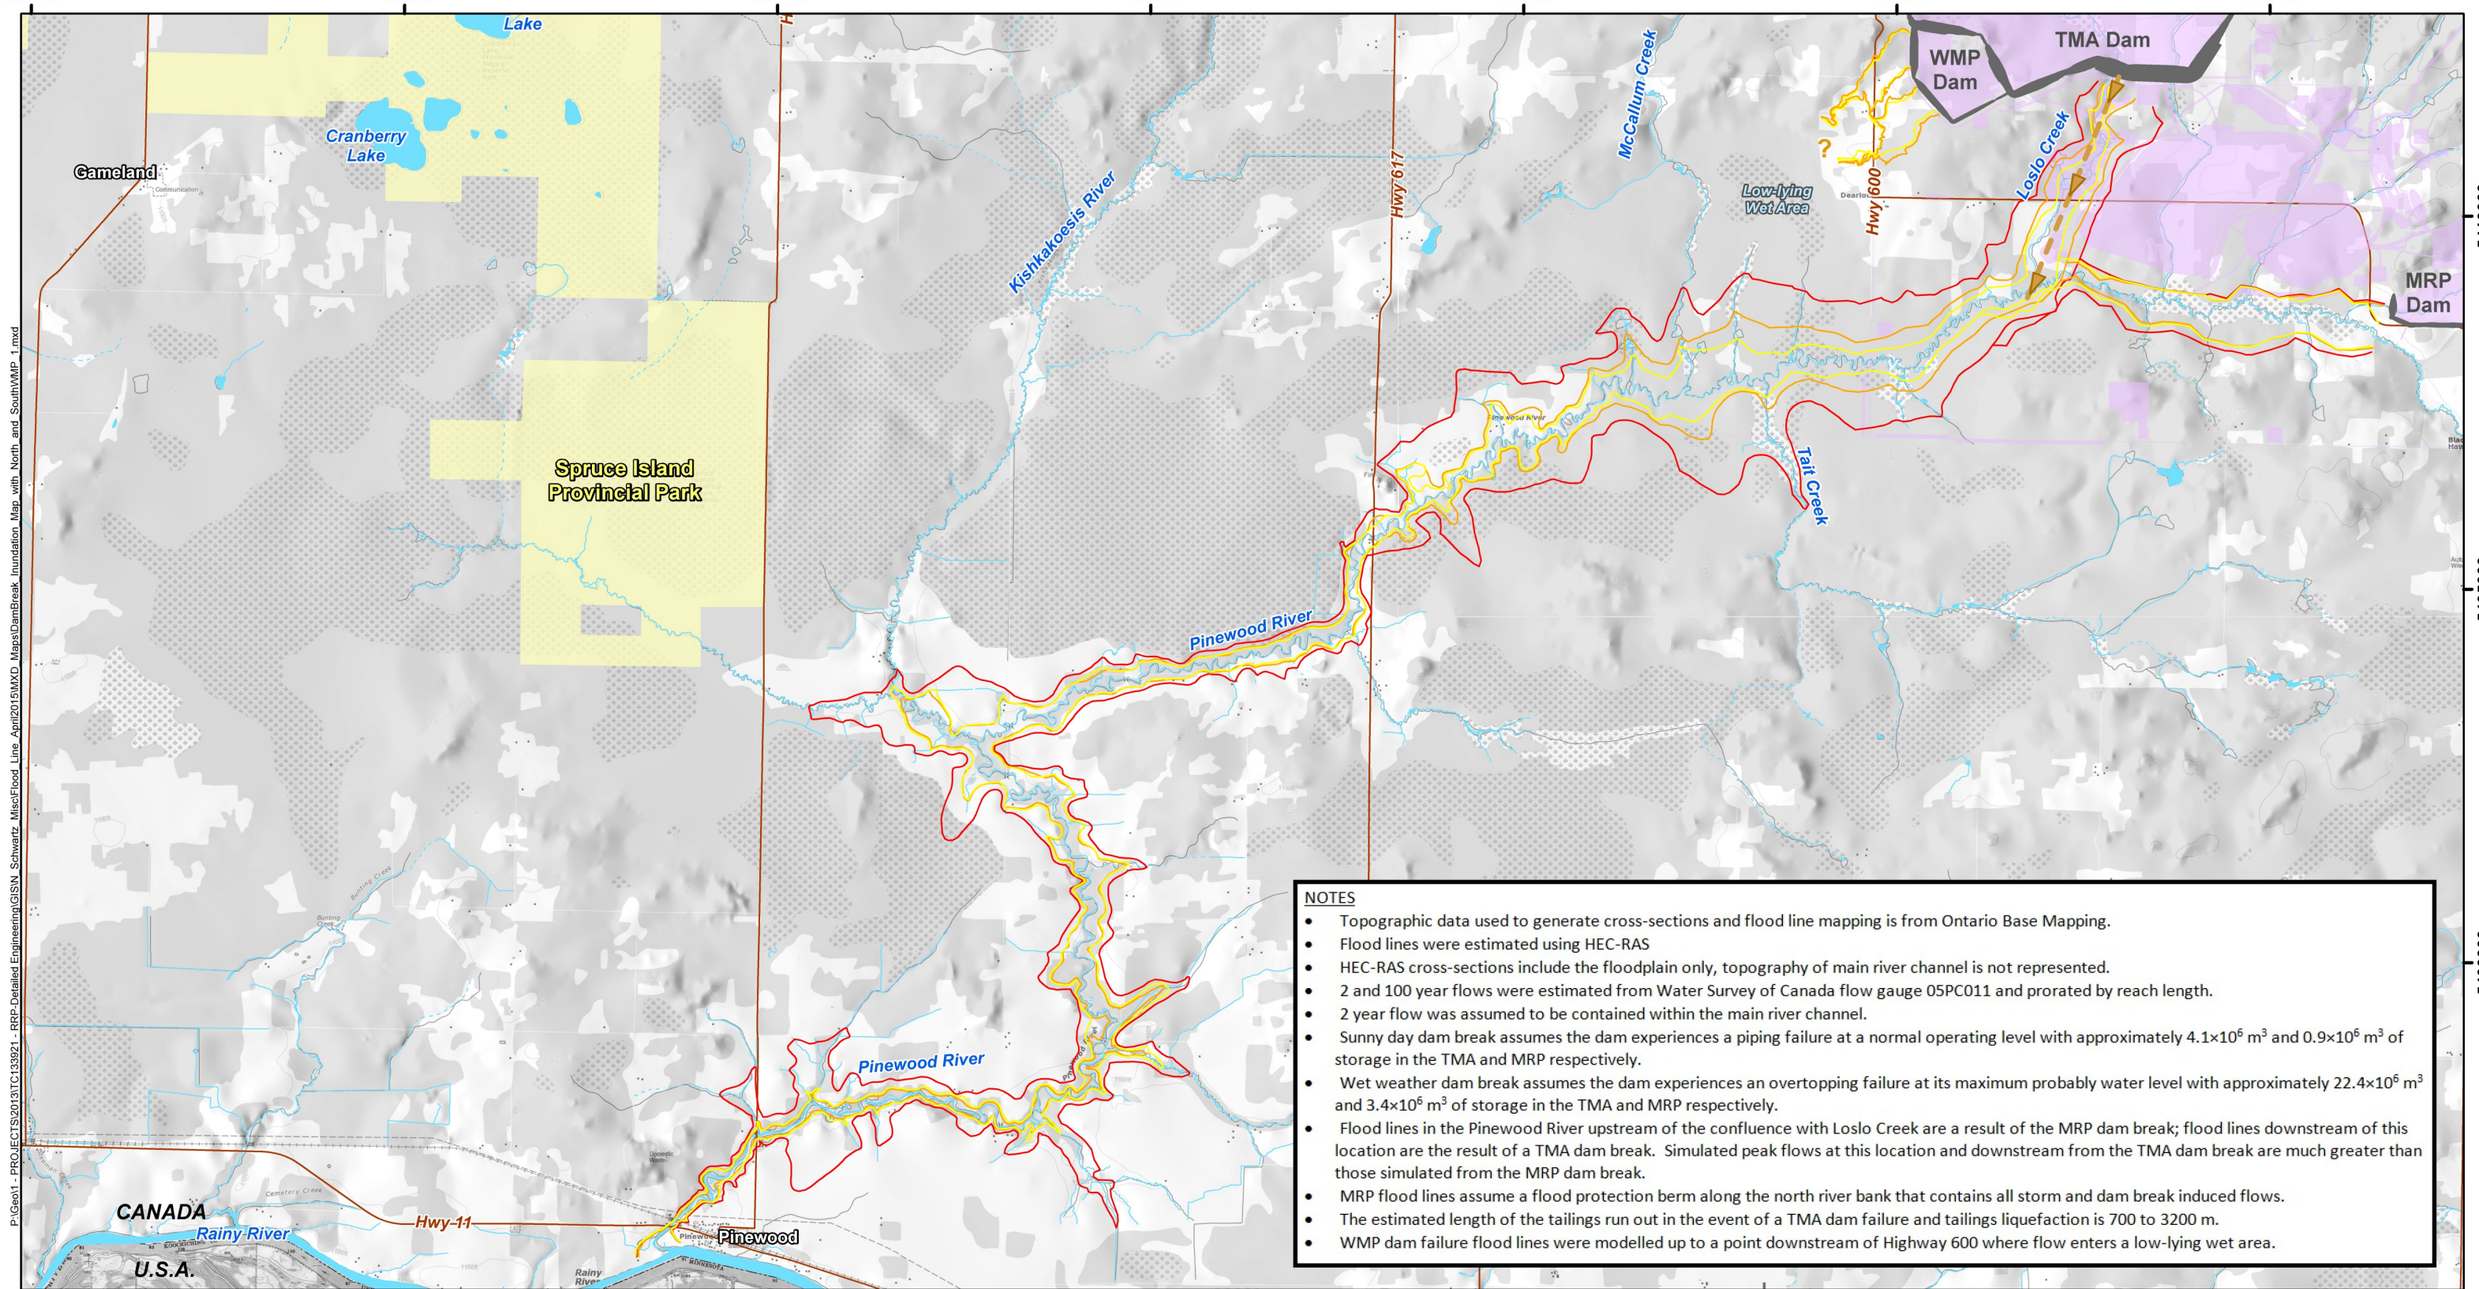
Table 9-1; Potential Failure Modes, Triggers and Observable Effects

Potential Failure Modes	Possible Causes	Visual Indications	Instrumentation Effects
Break down of pump stations	Blockages, lack of maintenance	No flows	Test on pumps and other related components
Pipeline damage, cracking, blocking, or freezing	Flows blocked by excessively turbid water, debris or ice blockages, extreme weather	No or partial flows; pipeline leaking, cracking or bulging	Pipeline thickness; line pressures; pipeline flow rates
Overtopping	Excessive foundation movements, high wind and wave erosion of beach landslide generated wave, erosion of freeboard, settlement of crest, gully growth towards upstream crest due to seepage, surface runoff or pipe ruptures	Instability in reservoir slopes – slumping, sliding, etc. Damage to upstream face of dam, breach of crest	None
Slope Failure	Changes to porewater pressure within the dam (filters becoming non-functional, earthquake included)	Bulging, slumping, sliding or cracking of dam, increase in volume of seepage	Increase in porewater pressures measured within dam
Foundation Failure	Changes to pore water pressure in the foundation or increases to load applied to foundation (Increase in dam height or pond elevation)	Bulging, slumping, sliding or cracking of dam, or natural ground surrounding the dam	Increase in porewater pressures measured within dam and/or foundation, increase in rate of movement observed in inclinometers and/or survey prisms

Potential Failure Modes	Possible Causes	Visual Indications	Instrumentation Effects
Surface Erosion	Waves, wind or precipitation	Slumping or raveling of upstream or downstream faces of dam	None
Internal Erosion	Erosion of core, creating a pipe/conduit for water flow through dam, growth of a gully behind the crest of dam, turbid seepage water	Rapid increase or unexplained cloudy appearance of seepage through the tailings dams and/or their foundations; appearance of seepage in new locations; formation of sinkholes in dam or on tailings beach	Rapid change if the in porewater pressures measured within dam and/or foundation
Cracking	Differential settlement of dam, earthquake induced	Cracks on dam crest or faces; bulging or slumping of dam	Increase to rate of movement observed in inclinometers or survey monuments or prisms

Other failure modes might also include the following:

- Slumping, sliding, cracking or bulging of the tailings dam
- Rapid increase or unexplained cloudy appearance of seepage through the tailings dam and/or its foundation
- Formation of sinkholes on the tailings beach or dam
- Breakage of tailings pipelines, which may result in dam erosion and/or release of tailings slurry
- Earthquakes
- Major storm events or flood
- Sabotage and other criminal activities



P:\Geo\1 - PROJECTS\2013\TC133921 - RRP-Detailed Engineering\GIS\N_Schwartz_Misc\Flood_Line_April2015\MXD_Maps\DamBreak_Inundation_Map_with_North_and_SouthVMP_1.mxd

NOTES

- Topographic data used to generate cross-sections and flood line mapping is from Ontario Base Mapping.
- Flood lines were estimated using HEC-RAS
- HEC-RAS cross-sections include the floodplain only, topography of main river channel is not represented.
- 2 and 100 year flows were estimated from Water Survey of Canada flow gauge 05PC011 and prorated by reach length.
- 2 year flow was assumed to be contained within the main river channel.
- Sunny day dam break assumes the dam experiences a piping failure at a normal operating level with approximately 4.1×10^6 m^3 and 0.9×10^6 m^3 of storage in the TMA and MRP respectively.
- Wet weather dam break assumes the dam experiences an overtopping failure at its maximum probably water level with approximately 22.4×10^6 m^3 and 3.4×10^6 m^3 of storage in the TMA and MRP respectively.
- Flood lines in the Pinewood River upstream of the confluence with Loslo Creek are a result of the MRP dam break; flood lines downstream of this location are the result of a TMA dam break. Simulated peak flows at this location and downstream from the TMA dam break are much greater than those simulated from the MRP dam break.
- MRP flood lines assume a flood protection berm along the north river bank that contains all storm and dam break induced flows.
- The estimated length of the tailings run out in the event of a TMA dam failure and tailings liquefaction is 700 to 3200 m.
- WMP dam failure flood lines were modelled up to a point downstream of Highway 600 where flow enters a low-lying wet area.

LEGEND

- Principal RRP Facilities
- Regional Road / Highway
- Permanent Watercourse
- Intermittent Watercourse

TMA and MRP Flood Scenarios

- Approximate Flood Line for 100 Year Flow
- Approximate Flood Line for 2 Year Flow + Sunny Day Dam Break
- Approximate Flood Line for 100 Year Flow + Wet Weather Dam Break
- Possible Tailings Run Out (estimate extent shown: 3,200 m)

WMP Flood Scenarios

- Approximate Flood Line for Piping Failure (north and south dam scenarios shown)
- Approximate Flood Line for Overtopping Failure (north and south dam scenarios shown)

Dam Break Inundation Map

DRAFT

PROJECT N°: TC133921 | **FIGURE:** 9-1

SCALE: 1:80,000 | DATE: May 2015

9.3 Warning Signs and Threshold Criteria

The warning signs for an emergency are defined below:

- Level I: Conditions that do not yet represent a potential emergency but that do require investigation and resolution on a prompt basis, along with intensified surveillance.
- Level II: Conditions that represent a potential emergency if allowed to continue to progress, but no such emergency is imminent.
- Level III: An obvious emergency has occurred or is imminent.

Table 9-2 discusses potential warning signs, consequences and actions to be taken.

Table 9-2; Warning Signs, Level of Emergency and Responses

Level	Warning Sign/Situation	Actual or Potential Consequences	Action(s) to be Taken
1	Unusually high, one-time reading from a single piezometer.	Possible early warning sign of worsening piezometric/seepage conditions.	• Check piezometer reading, and check for infilling of piezometer. • If reading confirmed, check all other piezometers, and examine downstream area of dam for changed seepage conditions. • Intensify piezometer readings.
	Decreased seepage discharge accompanied by gradually increasing piezometer levels.	Possible sign of clogging of internal drainage system of dam.	• Check chemistry of seepage discharge for any changes relative to normal. • Request tailings dam engineer to re-evaluate slope stability at this location.
	Increase in size of erosion gullies.	Possible erosion resulting from seepage and/overland runoff. May lead to accelerated erosion and result in dam failure.	• Backfill gullies with filter material and fine rockfill.
2	Increase in seepage discharge, accompanied by discharge of tailings within seepage (dirty water).	Possible indication of a developing internal erosion (piping), that could eventually lead to dam breach/pond release, or excessively high levels of saturation that could result in slope instability.	• Initiate chain of communication (Figure 9-2) and monitor the situation. • Discontinue tailings discharge in the seepage area. • Intensify monitoring of seepage at this location. • Note if the seepage discharge and/or turbidity continue to increase. • Read piezometers. • Be prepared to place filter material in area of discharge from emergency stockpiles.

Level	Warning Sign/Situation	Actual or Potential Consequences	Action(s) to be Taken
	Seepage on dam abutments, causing localized erosion and slumping of dam slope.	Could lead to progressive slope failure on abutment, resulting in dam failure and breach of pond.	• Discontinue tailings discharge in the seepage area. • Place filter material over seepage area using emergency stockpiles. • Continue to monitor area on an intensified basis. • Initiate chain of communications if situation does not improve.
	Extended period of unusually heavy rainfall, or unusually large snowmelt.	Could lead to raised levels of saturation within the dam slope, which could in turn lead to slope instability.	• Increase frequency of piezometer readings to weekly. • Intensify inspections of downstream dam slope, looking for signs of localized instability/concentrated gully erosion, and for soft ground (saturated slope) conditions.
	Relatively high, unexplained, and ongoing increase in piezometer levels within the dam and/or foundation – threshold limits being approached.	Probable sign of progressive deterioration of toe drainage provided by starter dams. Could, if left unattended eventually lead to failure of the dam.	• Assess rate of rise and determine if it is steady or accelerating. • If piezometer level increase was sudden, check the reading (repeat it) to eliminate the possibility of a reading error. • Sound bottoms of piezometers to check for infilling. • Send piezometer readings to the tailings dam engineer. • Inspect downstream area for increased seepage and/or turbidity of seepage discharge.
	Long term or sudden increase in rate of inclinometer movements.	Possible sign of impending slope instability.	• Check reading, and contact the Geotechnical Engineer and EOR if confirmed. • Inspect area for any visible signs of instability, bulging on outer slope or at toe, or tension cracks on dam crest. • If tailings discharge is occurring near the inclinometer that indicates unexplained movement, relocate discharge point further away. • Increase frequency of inclinometer readings. • Read nearby piezometers.
	Ongoing cracking and evidence of dam and/or foundation movement.	Possible sign of impending failure of dam, especially if the rate of movement/cracking is accelerating.	• Check inclinometer readings. • If rate of deformation is accelerating, initiate chain of communication. • Read piezometers. • Check for water inflow into tension cracks. • Regrade to channel runoff away from tension cracks, as water inflow can result in accelerated movement.

Level	Warning Sign/Situation	Actual or Potential Consequences	Action(s) to be Taken
	Highly turbidity discharge from decant outlet.	Possible sign of collapse of a portion of the decant, allowing tailings into outlet. Can, if left unattended, lead to internal erosion failure and eventual dam breach.	• Check decant inlet to see if water turbidity matches that in discharge. • If water at inlet is clear, then close off decant inlet to prevent further discharge. • Notify tailings dam engineer and develop alternate decant arrangements. • Inform Mill.
	Rupture of tailings and/or water pipelines on crest of dam, resulting in erosion of downstream dam slope	Could lead to erosive failure of dam, and pond breach, if allowed to continue.	• Contact Mill and have discharge of tailings stopped. • Repair the rupture. • Inspect and repair the washed-out portion of the dam slope. • Do not discharge tailings into the area of the washout. • Notify tailings dam engineer to design slope re-construction.
	Seepage daylighting from tailings slope at a significantly higher elevation than had previously been observed at that particular location.	Could lead to erosion, and progressive slope failure, resulting in dam failure and breach of pond.	• Read piezometers. • Assess rate of seepage and whether or not internal erosion is occurring. • If piezometers confirm high phreatic levels, initiate chain of communication. • Carry out weekly monitoring of the seepage discharge area of concern. • Avoid discharge of tailings into the impoundment adjacent to the area.
	Severe flood/intense rainstorm or rapid snowmelt.	Overtopping and washout of dam, and release of pond. Concentrated erosion of tailings slopes, resulting in localized gullying, over-steepening, and potential slope failure. Raising of phreatic surface as a result of infiltration possible.	• Initiate chain of communications (Figure 9-2). • Check the minimum width of tailings beaches. • Inspect spillway for flow and condition. • Stop tailings discharge and slowly lower tailings pond by removing stop logs. • Carry out detailed inspection of dam and pond. • Inspect dam slopes for areas of concentrated erosion, and repair. • Read all piezometers. • Mobilize emergency pumps if needed.
3	Failure or suspected imminent failure of a dam.	Catastrophic breach and release of pond.	• Initiate chain of communications (Figure 9-3). • Stop tailings discharge and lower tailings pond by removing stop logs.

Level	Warning Sign/Situation	Actual or Potential Consequences	Action(s) to be Taken
	Slumping, sliding, or bulging of a dam slope or adjacent ground.	Catastrophic breach and release of pond.	• Initiate chain of communications (Figure 9-3). • Lower pond by removing stop logs. • Do not attempt construction (e.g., construction of a stabilizing berm) until the EOR is on the site (earthmoving equipment should be mobilized).
	Water vortex (whirlpool) within the tailings pond.	Indicates an internal erosion failure in progress, with potential breach of the tailings dam.	• Initiate chain of communications (Figure 9-3). • Stop tailings discharge and lower tailings pond by removing stop logs. • Check downstream area of dam for areas of increased and/or turbid seepage discharge. • Place granular filter buttress against any such areas, using emergency stockpiles. • Go directly to decant outlets if vortex is on a decant line; plug decant outlet with granular material if tailings are discharging through decant.
	Sinkhole observed on tailings beach or on a downstream dam slope.	Indicative of internal erosion, which could progress to the point where dam breach results.	• Initiate chain of communications (Figure 9-3). • Stop tailings discharge and lower tailings pond by removing stop logs. • Immediately check dam toe areas/decant outlets for heavy seepage that is transporting tailings solids. • Place granular filter buttress against any such areas, using emergency stockpiles.
	Large earthquake.	Dam failure, breach and release of pond.	• Initiate chain of communications (Figure 9-3). • Carry out detailed post-earthquake inspection of the dam. • Read all instrumentation (piezometers and inclinometers).
	Rapid, unexplained, orders of magnitude increase in seepage rate and turbidity (dirty water indicating transport of tailings) at a dam slope seepage location and/or foundation.	Internal erosion (piping) failure leading to dam breach and release of pond. Elevation of pore pressure conditions that could initiate a slope failure.	• Initiate chain of communications (Figure 9-2). • Place stockpiled filter materials over seepage discharge area to prevent further erosion of material. • Read piezometers in area of seepage discharge.

9.4 Incident Notifications Procedures

Roles and responsibilities:

- Any individual who observes an incident shall initiate the appropriate notification procedure.
- All members listed on the notification procedures shall be familiar with established protocol and familiar with the OMS Manual (as per training Section 2.5).
- If a member of the team on the notification procedures is not contactable then the Incident Commander shall be notified and proceed with the notification procedure.

Notification procedures have been developed for Level I, II and III emergencies provided below to ensure quick onsite responses in the event of an identified emergency. The Mill Manager will be in charge of initiating the site wide EPRP (NG, 2017) in the event of a Level III emergency.

The notification procedures for a Level I and Level II emergency are illustrated on Figure 9-2. The notification procedure and initiation of the EPRP in the event of a Level III emergency is shown on Figure 9-3. Rapid response to Level III emergencies is critical to ensuring that staff, contractors and site visitors safely reach a muster station and that timely notification is made to appropriate local and provincial authorities as well as external stakeholders.

Figure 9-2; Levels I and II Emergency Notification Procedure Flowchart

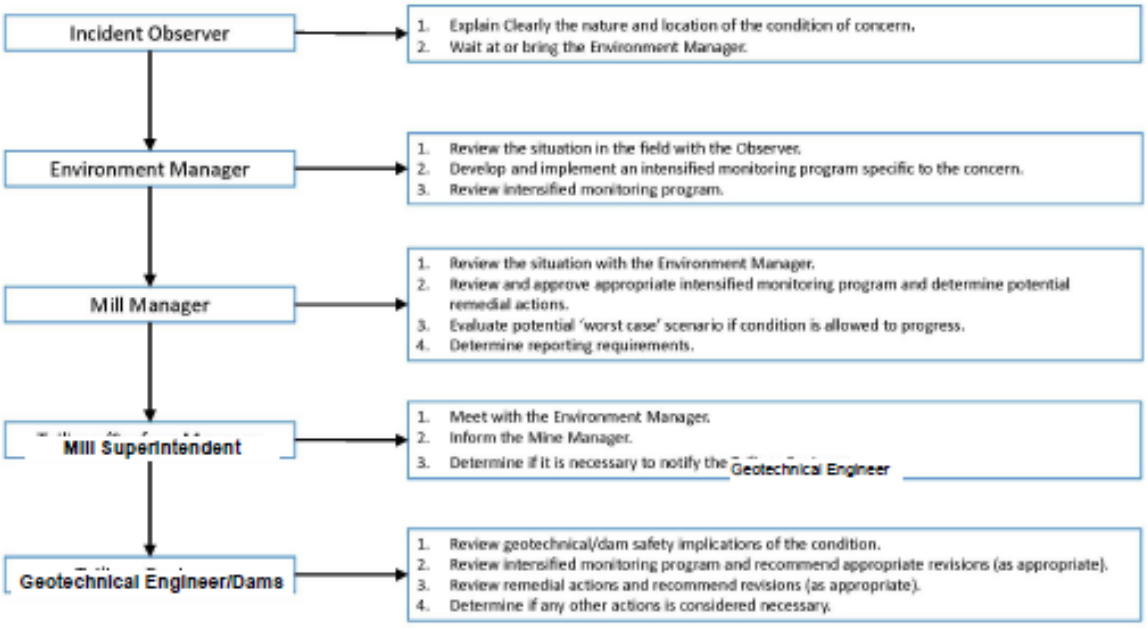

Figure 9-3; Level III Emergency Notification Procedure Flowchart

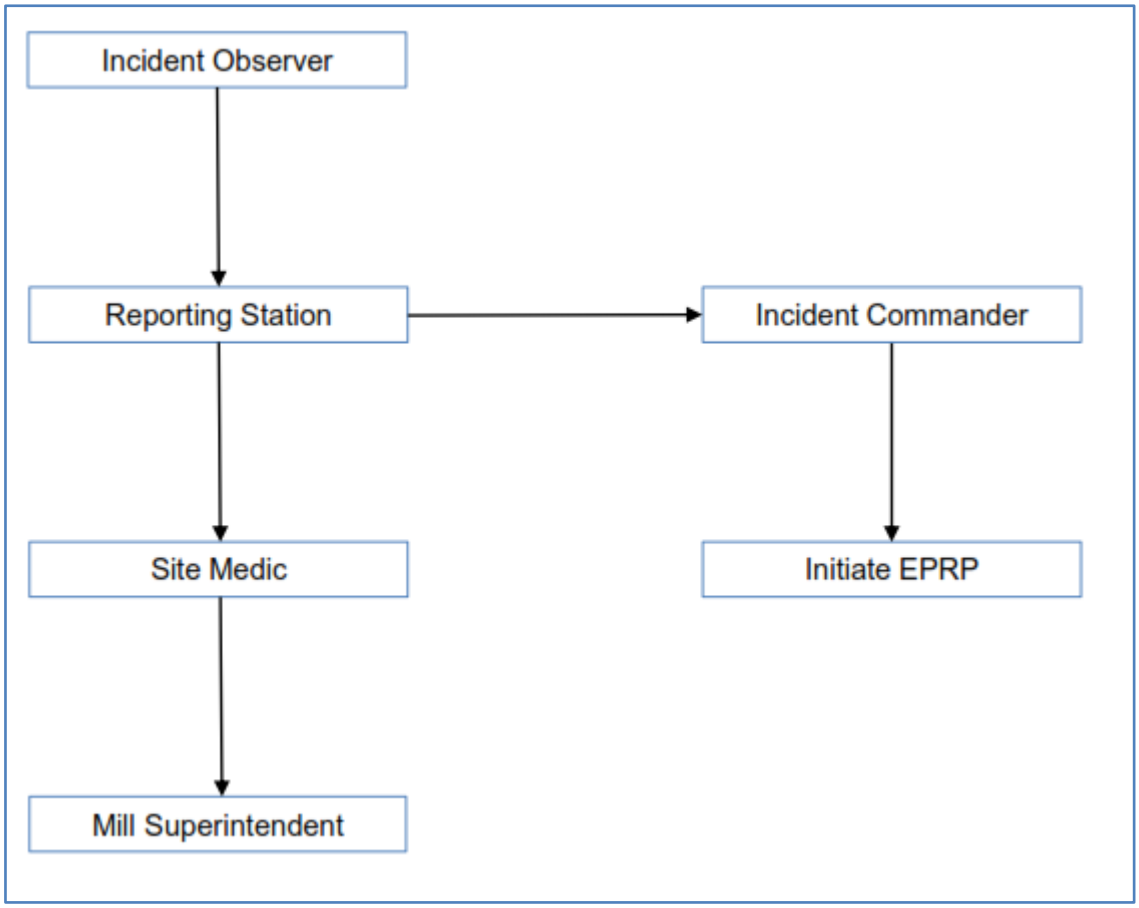

9.5 Emergency Contacts

Internal emergency contact information is provided RRM EPRP. An emergency response can be initiated through;

- RRM radio channel 4 – state 'Emergency, Emergency, Emergency' and describe the type and location of the emergency
- RRM internal phone system – dial 8888
- RRM security direct line – 1-807-708-0646
-

9.6 Emergency Preparedness Procedures

All employees, including contractors working at the RRM must be familiar with the procedures outlined in the EPRP for the site and TMA to the extent required to perform their functional role. All supervisors and contact persons for contractors must ensure their employees understand those procedures relevant to their work area and ensure that their employees are familiar with,

and recognize the proper course of action in the event of an emergency. The supervisor must also ensure that all employees are made aware of any revisions to the EPRP for the site and TMA.

The EPRP is the site and TMA's guidance document relating to emergency responses and protocols to be followed during upset conditions, unusual events or incidents. A preliminary dam break inundation map is provided in figure 9-3.

Emergency preparedness measures with regard to dam safety include: maintenance of access to dam locations; availability of fill materials and equipment required in the event that remedial works are required; and the ability to access and traffic control measures to ensure safety of workers and public.

10.0 CONTINGENCIES

The operations are sensitive to water balance and water quality in discharges. The following are contingencies based on water management and functioning of the diversions.

10.1 TMA

10.1.1 Cell 1 contingency

- Maintain or add additional pumping capacity to the WMP to drain the cell if required due to the MOWL being exceeded;
- Manage filling of the WMP to consider additional storage capacity of the EDF from cell 1; and
- Accelerate construction of cell 2, where permitted.

10.1.2 Cell 2/3 Contingency

- The TMA has been designed to operate with a pond volume of 4-6 Mm^3, with additional capacity for up to 8 Mm^3. In a wet year pumping to the WMP can be extended longer than planned and discharged from the WMP, pending receptor capacity (Pinewood River flow)
- Any additional precipitation events after the EDF, prior to dewatering, could cause an uncontrolled release of untreated water to the environment, and alternative contingency measures would be required to reduce the water level at a faster rate (i.e. such as pumping excess water to the open pit or transferring TMA Cell 2 water into the WMP with no treatment).
- Pumping will be considered directly from the WMP to TMA Cell 3 to reduce WMP volumesto 1.0 Mm^3 prior to discharge from Cell 2 through the WTP into the WMP.
- Water treatment plant to be completed in September 2018 to allow pumping from cell 2, if required
- TMA raises to be sequenced to avoid a water deficit, however, reduction in discharges to the CW and additional takings from the Pinewood River, West Creek and Clark Diversions will be considered, subject to maintaining minimum flows

10.2 Process Water

10.2.1 Water Management Pond

- Accelerate, where permitted, completion of TMA to enable draining of WMP;
- Additional pumping capacity to cell 2/3; and
- Implement contingencies for Water Quality as outlined below (Water Treatment).

10.2.2 Mine Rock Pond

- If the MRP MOWL (356.8m) is exceeded, then pumping into the MRP from the open pit will cease and pumps will pump water toward the plant site/WMP/TMA at 680 m^3.
- Overtopping of the Clark Creek Dam was considered in the design of the MRP. The Clark Creek Dam and Pond are designed for a 1:100 year 24h event, if this is exceeded

then water will spill from the dam and flow toward the EMRS. Water on the eastern side of the EMRS reports to a sump and flows through NAG rock under the EMRS to the MRP. Given this flow path the contribution of this flow is not significant on the peak inflows to the MRP.

10.3 Water Treatment

Two contingency plans have been developed as part of MOECC approvals for water treatment;

- Pinewood River Quality Contingency Plan, Version 1 August 2016; and
- Groundwater and Surface Water Contingency Plan, Version 2 October 2015.

Contingency options are to limit discharges, acceleration of TMA dam raises, add water quality treatment, additional monitoring, provision of water to affect areas and increased mixing ratios/improved mixing. The trigger for implementation of contingency in surface water is if protection of aquatic life criteria are not achieved 90 % of the time. The trigger for contingencies in groundwater is if water quality parameters exceed background metals concentrations in groundwater at the mining lease boundary or groundwater wells outside of the zone of influence are affected.

10.4 Freshwater Diversions

There are specific contingencies required, based on the Fisheries Act authorization (application Table 6) for the freshwater diversion that relate to the OMS i.e., not biological. These are provided in the following table.

Table 10-1; Contingencies for Freshwater Diversions

Attribute	Mode of Failure	Contingency
Physical construction of offset measures	• Dam not constructed as per plans • Channel not constructed as per plan. • Water area, depths and or habitat structures not in place or present as per the plans.	• Engineer to assess failure and recommend corrective actions. • Proponent to take required corrective action.
Physical function of offset measures	• Conditions do not provide for fish passage	• Engineer / biologist to assess cause of failure and recommend corrective actions. • Take required corrective action
	• Water level not consistent with those specified in plans.	• Adjust grades of structures to alter • water levels • Excavate pools to specified depths.
Stability of structures	• Constructed habitat features (log and boulder structures) missing or not functional	• Repair or replace structures
	• Shorelines and graded offset features not stable (less than 80% of features are considered stable)	• Assess cause and areas of instability • Add permanent erosion control (rock, vegetation) in areas of erosion • Grade channel or shore to decrease velocity
	• Riparian vegetation cover and plantings are less than 80% coverage of area, and or survival of planted stock	• Apply seed and replacement plantings where required • Substitute species, and/or use soil amendments if conditions require.

APPENDIX C

NEW GOLD TAILINGS, HEAP LEACH AND WASTE ROCK FACILITIES MANAGEMENT POLICY

newgold

Tailings, Heap Leach and Waste Rock Facilities Management Policy

New Gold Inc. and its subsidiaries (together "**New Gold**") are committed to excellence in the management of tailings, heap leach and waste rock storage facilities. We will accomplish this by adopting internationally recognized standards including the Mining Association of Canada's *Towards Sustainable Mining* Tailings Management protocol wherever applicable.

New Gold makes the following commitments at all of its operations and projects:

- Identifying, assessing and controlling risks associated with tailings, heap leach and waste rock storage facilities.
- Ensuring that all aspects of our tailings, heap leach and waste rock storage facilities comply with regulatory requirements, sound engineering practice and company standards through regular inspection, program review and external audit.
- Locating, designing, constructing, operating, decommissioning and closing our tailings, heap leach and waste rock storage facilities so that all structures are stable and that all solids and water within the designated areas are managed to minimize or prevent possible pollution.
- Training our employees to enable them to carry out their responsibilities with regard to tailings, heap leach and waste rock storage facilities management.
- Communicating with Communities of Interest in order to take into account their concerns and considerations with regard to tailings, heap leach and waste rock storage.

New Gold believes that by adopting these commitments, the safe storage of tailings, ore and waste rock will be achieved and future Communities of Interest will not be adversely impacted by their existence.

Re: **Rainy River Project Development**
TMA Cell 2 and WMP Water Balance
RRP-GEO-REP-026 R1 **ISSUED FOR USE**

1.0 INTRODUCTION

Amec Foster Wheeler Environment & Infrastructure, a Division of Amec Foster Wheeler Americas Limited (Amec Foster Wheeler) was retained by New Gold Inc. (New Gold) to provide engineering services to prepare the detailed design of an internal tailings depositional cell (TMA Cell 2) located within the footprint on the ultimate Tailings Management Area (TMA) at the Rainy River Project near Fort Frances, Ontario. This includes preparing a water balance for TMA Cell 2 to evaluate water availability, water storage capacity and requirements for tailings deposition in TMA Cell 2. This memorandum presents the input data, calculations, operational and design considerations and results for the water balance.

2.0 DESIGN BASIS

- Commissioning Begins — September 14, 2017
- Commercial Production — October 31, 2017
- Assumed Production — October 1, 2017 (for water balance analysis)

Mine Production

- Start Date — October 2017 (into TMA Cell 1)
- Production Rate — 21,000 t/day

Amec Foster Wheeler Environment & Infrastructure
a Division of Amec Foster Wheeler Americas Limited
160 Traders Blvd. E., Suite 110
Mississauga, Ontario, L4Z 3K7
Tel: (905) 568-2929
Fax: (905) 568-1686
amecfw.com

Tailings Properties

- Solids content of slurry — 46.9 % solids by mass
- Specific gravity of solid tailings particles — 2.82
- Void ratio of deposited tailings — 1.0
- Tailings water content at saturation — 35.5%
- Dry density of settled tailings — 1.41 t/m^3

TMA Cell 2

- Design capacity — 12 months
- Dam crest elevation — 366.5 m
- Spillway invert elevation — 364.7 m
- Minimum operational pond volume — 500,000 m^3 (for settling of solids)
- Slope of tailings beach and pond — 1.0% and 4%
- Tailings slurry inflow rate — 23,776 m^3/day
- Reclaim rate to mill — 23,556 m^3/day
- Tailings pore water losses — 7,447 m^3/day
- TMA Cell 2 begins impounding runoff — April 2018
- Initial TMA Cell 2 water level — 357.00 m (0 m^3 of storage)
- Tailings deposition begins — April 2018
- Reclaim from TMA Cell 2 begins — After WMP volume is less than 1.0 Mm^3
- TMA Cell 2 to WMP transfer rate (treat) — 40,000 m^3/day
- TMA Cell 2 to TMA Cell 3 transfer rate — 40,000 m^3/day

TMA Cell 3

- Cell 3 begins impounding runoff — June 2018
- Cell 3 is available for pumping from Cell 2 — July 2018
- Cell 3 Dam attains full storage capacity — September 2018

WMP

- Dam crest elevation — 371.5 m
- Spillway invert elevation — 370.5 m
- Maximum allowable water level — 369.5 m (5.0 Mm^3 of storage)
- Initial WMP water level — 365.10 m (2.0 Mm^3 of storage)
- Reclaim rate to mill — 23,556 m^3/day (starting April 1, 2018)
- Reclaim from WMP — Until WMP volume < 1.0 Mm^3

Note: All dates provided in design basis are the first of the month

3.0 DESIGN CRITERIA

This water balance evaluation was completed to determine operating rules for TMA Cell 2 and the WMP during the operating life of TMA Cell 2 (April 2018 – April 2019). The water balance was used to evaluate and determine the necessary conditions so that sufficient water inventory will be available for processing plant operation in the winter of 2018, and so that adequate storage will be provided below the spillway invert to contain the Environmental Design Flood (EDF). The water balance evaluation was carried out for average, 1:20 wet and 1:20 dry climatic and streamflow conditions.

Water contained in the WMP needs to be of a suitable quality for discharge to the environment. During the initial 6 months of operation, the WMP will receive tailings-contact water from TMA Cell 1 (operating months: 1 October 2017 to 31 March 2018), with a projected water inventory of 2 Mm^3 (1.0 Mm^3 of free water and 1.0 Mm^3 as ice) at the end of this period. At the start of TMA Cell 2 operation (April 2018), TMA Cell 2 is expected to fill quickly due to the typically high runoff in April, May and June. To manage the increase in TMA Cell 2 water volume, it is proposed to transfer water from TMA Cell 2 to the WMP in this period, which will increase the WMP volume. In addition, it is planned to pump from the Pinewood River (to the extent permitted) to increase the WMP inventory as a contingency against possible dry conditions in summer or fall. The WMP will be maintained below its maximum operating water level (MOWL) by reclaiming water from it to the processing plant during the first few months of TMA Cell 2 operation. During the drawdown of the WMP, storage in TMA Cell 3 will become available to transfer TMA Cell 2 excess water. Once the Water Treatment Plant (WTP) becomes available it will be used to treat and transfer excess water from TMA Cell 2 to the WMP. From that point on, there will be blending of untreated residual effluent (minimized to the extent possible) with treated TMA Cell 2 effluent in the WMP.

In order to provide the system with sufficient flexibility to discharge to the environment in the spring of 2019, the WTP should be available in September 2018 to treat water entering the WMP from TMA Cell 2. Delaying startup of the WTP could result in filling both TMA Cell 2 and the WMP with untreated water, which is not recommended due to the project risk of discharging out of compliance water if high runoff events occur with both ponds nearly full. A flow schematic for site water management is provided in Figure 1.

4.0 AVAILABLE STORAGE

Capacity for water storage in the TMA Cell 2 will reduce during the 12-month period with progressive tailings deposition. Stage-storage curves for end of month 2, month 6, and month 12 were developed based on tailings deposition modelling. For intermediate months, stage-storage curves were interpolated for use in the water balance. The stage-storage relationships for the TMA Cell 2 and WMP are provided in Figures 2 and 3, respectively.

New Gold has indicated that TMA Cell 3 will be completed and available to impound water on June 1, 2018. For the purposes of this water balance analysis, it has been assumed that TMA Cell 3 storage will become available progressively between June 1 and September 1, 2018.

5.0 METEOROLOGICAL DATA

Site runoff is represented in the water balance based on mean annual precipitation of 694.8 mm. Annual precipitation was re-distributed using the monthly distribution of streamflow from the Pinewood River to account for snowmelt (distribution based on WSC gauge 05PC023). Return period estimates for the 1:20 wet and dry years were generated using the Gumbel double exponential distribution for annual extremes. Mean annual pond evaporation is 538 mm. The meteorological data used for the water balance are listed in Table 1.

Table 1: Mean Annual Meteorological Data

Month	Average Year Available Precipitation (mm)[1]	1:20 Wet Year Available Precipitation (mm)[2]	1:20 Dry Year Available Precipitation (mm)[2]	Pond Evaporation (mm)[1]
Jan	4.51	6.20	2.66	0
Feb	2.72	3.75	1.60	0
Mar	61.12	84.01	35.99	0
Apr	221.10	303.92	130.20	0
May	117.31	161.25	69.08	109
Jun	118.97	163.54	70.06	110
Jul	59.29	81.49	34.91	129
Aug	8.16	11.22	4.81	104
Sep	20.41	28.05	12.02	63
Oct	34.89	47.96	20.55	23
Nov	38.37	52.75	22.60	0
Dec	7.95	10.93	4.68	0
Year	694.8	955.1	409.2	538

Notes:

1. Reference: Precipitation was distributed according to average streamflow at Pinewood River WSC gauge 05PC023 in order to simulate runoff
2. 1:20 wet year and 1:20 dry year estimates are based on Barwick, Ontario climate data from Environment Canada and were derived using the Gumbel double exponential distribution for annual extremes.

6.0 HYDROLOGY

Runoff was calculated as the product of monthly precipitation, catchment area, and runoff coefficient. The catchment areas and runoff coefficients used are provided in Table 2. Runoff from the open pit and Mine Rock Pond (MRP) areas were assumed to be pumped to TMA Cell 2. Runoff from the Start-Up Cell (TMA Cell 1) will passively overflow to TMA Cell 2.

Table 2: Hydrologic Parameters for Water Balance

Parameter	TMA Cell 1	TMA Cell 2	TMA Cell 3	WMP	Open Pit	Mine Rock Pond
Area (km^2)	0.68	8.22	2.11	1.11	3.17	5.34
Runoff Coefficient	99.2%	54.0%	53.5%	83.6%	44.5%	45.8%

Runoff coefficients for the water balance are the same as those utilized in the detailed design water balance (AMEC, 2014). The MRP drainage area has a pond area of approximately 0.66 km^2, and the remaining area was assumed to be 75% natural ground cover and 25% waste rock. The open pit area (including upstream catchment area) of 3.17 km^2 consists of 0.54 km^2 is open pit (Phase 1 open pit area) and the remainder natural ground cover. A constant seepage inflow of 3,000 m^3/day has been assumed as groundwater inflow into the open pit (ultimately pumped to TMA Cell 2).

7.0 INITIAL CONDITIONS

TMA Cell 2 is assumed to be empty April 1, 2018 and to begin impounding water immediately. The WMP is expected to have approximately 2.0 Mm^3 of water on April 1, 2018 based on the pre-winter inventory calculation from the TMA Cell 1 water balance (Amec Foster Wheeler, 2016b). The pre-winter inventory was the minimum amount of water required to run the mill through the winter of 2017/2018. TMA Cell 3 is assumed to be empty June 1, 2018 and to begin impounding runoff immediately.

8.0 PUMPING FROM PINEWOOD RIVER

Depending on the volume stored in the WMP on April 1, 2018, it may be advisable to pump water from the Pinewood River to the WMP to build inventory for processing needs to offset a possible shortfall in the event of dry conditions later in the year. This water balance assessment indicates that pumping from the Pinewood River is recommended if the total water volume in the WMP and TMA Cell 2 is below 4 Mm^3. The pumped volume was estimated based on the following rules which reflect PTTW water taking restrictions and the Pinewood River pumphouse capacity (Amec Foster Wheeler, 2016a):

- Water taking from the Pinewood River is restricted to not more than 20% of the river flow from the period of March 1 through July 31, and to not more than 15% of the river flow for the period from August 1 through November 30, as measured at the Pinewood River pumphouse location;

- Pinewood River water takings must take into consideration watershed capture at the Mine site (i.e., water captured at the Mine site is to be considered as part of the 20%/15% Pinewood River water taking);

- Additional to the 20%/15% water taking restrictions, direct water taking from the Pinewood River is not to reduce downstream flows in the river to a value of <10,000 m^3/d during the spring period, or to less than 5,000 m^3/d during the summer/fall period;

- No water is to be directly taken from the Pinewood River during the winter period (December 1 to February 28); and

- The Pinewood River pumphouse capacity is restricted (by the equipment) to approximately 25,000 m^3/d.

The simulated pumped flows from the Pinewood River are provided in Table 3.

Table 3: Available Water Takings from Pinewood River to WMP

Month	Average Year (1984)	Wet Year (1992)	Dry Year (1987)
	m^3/month	m^3/month	m^3/month
Apr-2018	750,000	750,000	107,932
May-2018	0	0	317,708
Jun-2018	0	0	190,393
Jul-2018	0	0	-
Aug-2018	0	0	-
Sep-2018	0	0	17,683
Oct-2018	483,386	0	15,652
Total	1,233,386	750,000	633,716

Notes:
- Volume of water pumped from the Pinewood River may vary depending on wet or dry conditions for precipitation
- Pumping from Pinewood River only occurs if volume in TMA Cell 2 and WMP is less than 4.0 Mm^3

9.0 MILL RECLAIM

During the initial months of TMA Cell 2 tailings deposition starting on April 1, 2018, mill reclaim will be taken from the WMP (similar to during TMA Cell 1 deposition, where all reclaim was taken from the WMP). Reclaiming from the WMP will continue until the WMP volume is reduced to below 1.0 Mm^3 in order to help build an initial pond inventory in TMA Cell 2, and will also help extract tailings-contact water from WMP to the extent possible. After the WMP volume is reduced to below 1.0 Mm^3, mill reclaim will be shifted to TMA Cell 2 to limit the TMA Cell 2 tailings pond volume as tailings deposition continues to reduce available storage.

10.0 WATER TREATMENT

During the initial stages of tailings deposition in TMA Cell 2 there will be no discharge from the WMP since water quality is not anticipated to be acceptable for release to the environment (note that during tailings deposition in TMA Cell 1, all reclaim was taken from the WMP for this reason). Once reclaim is shifted to TMA Cell 2, the WMP should have a relatively small volume; however water quality will still not be suitable for discharge to the environment, and water treatment will be necessary prior to discharge (either through bleed flow to the wetland, or through the effluent pipeline to the Pinewood River).

The proposed Water Treatment Plant (WTP) will be located within the WMP and will provide treatment as water is transferred from TMA Cell 2 to the WMP (for ultimate discharge to the environment). The proposed WTP is designed to operate at 40,000 m^3/day for 6 months of the year (AMEC, 2014). The timing on the need for water treatment will vary depending on the climactic conditions of 2018, however it is expected to be required by November 1, 2018 if precipitation is above average. As a contingency to deal with the possibility of significant wet conditions, it is recommended that the WTP be operational by September 1, 2018. This accounts for the use of storage in TMA Cell 3 which will delay the need for the treatment plant from the early summer of 2018 to the fall of 2018. The treatment plant is needed due to TMA Cell 2 having a relatively limited storage volume combined with its large catchment area (almost as large as the ultimate TMA). Once the treatment plant is operational, the water management strategy for the TMA would be similar to the original design (TMA transfer to WMP in the summer, and WMP discharge to the environment in the spring and fall).

11.0 EFFLUENT DISCHARGE

Following the commissioning of the WTP, water in the WMP will be suitable for discharge to the environment, provided that no discharge occur until the WMP fills to a volume of approximately 5.0 Mm^3 to provide sufficient dilution of its remaining 1Mm^3 of tailings contact water with treated water. During a wet year it would be necessary to pump water from the WMP to the Pinewood River in the spring of 2019 (following the duration of this simulation). The timing of the commissioning of the WTP in the fall of 2018 is critical to ensuring that the water in the WMP is of sufficient quality for discharge to the Pinewood River.

12.0 RESULTS

The following results of the water balance evaluation are based on TMA Cell 3 being available for water storage by June 1, 2018, and the WTP being available by September 1, 2018. In this evaluation, all pumped withdrawals from TMA Cell 2 (whether to the WMP, to the WTP, or to TMA Cell 3) are assumed to be at a rate of 40,000 m^3/day. The timing of these withdrawals should be determined based on the storage available in TMA Cell 2, TMA Cell 3 and the WMP (further details are provided in Section 14 below).

Table 4 provides a summary of the cumulative water inputs to the TMA during TMA Cell 2 operation. This is the net inflow (i.e. inflow minus outflow) on a cumulative basis, representing the total water in the system that requires storage (or discharge).

Table 4: Cumulative Net Water Inputs to TMA during TMA Cell 2 Operation

End of Month	Cumulative Inputs - Average Year	Cumulative Inputs - 1:20 Wet	Cumulative Inputs - 1:20 Dry
April 2018	2,000,000	2,000,000	2,000,000
May 2018	4,737,729	5,535,560	3,220,060
June 2018	5,374,749	6,595,891	3,710,215

End of Month	Cumulative Inputs - Average Year	Cumulative Inputs - 1:20 Wet	Cumulative Inputs - 1:20 Dry
July 2018	6,086,384	7,787,172	4,085,840
August 2018	6,078,090	8,017,892	3,866,379
September 2018	5,650,139	7,589,852	3,490,708
October 2018	5,484,569	7,506,546	3,283,697
November 2018	6,109,474	7,788,731	3,286,492
December 2018	6,380,357	8,214,318	3,387,591
January 2019	6,319,059	8,185,064	3,291,125
February 2019	6,220,785	8,104,984	3,172,884
March 2019	6,117,479	8,012,662	3,057,522
April 2019	6,847,735	8,973,362	3,301,749
	Cumulative net water inputs to the TMA consist of inputs minus outputs. Inputs consist of runoff (TMA Cell 1, TMA Cell 2, TMA Cell 3, MRP, open pit), open pit groundwater, and water in tailings slurry Outputs consist of pond evaporation (TMA Cell 1, TMA Cell 2, TMA Cell 3, MRP), reclaim to mill, and tailings pore water losses		

Figure 4 is a summary chart which shows the cumulative net inflow as shown in Table 4 versus total available storage in TMA Cell 2, TMA Cell 3 and the WMP. Note that the total storage available is below the MOWL providing an allowance for storage of the EDF event. The total storage in the WMP will be reduced from around 5.0 Mm^3 to 1.0 Mm^3 in the fall of 2018 to ensure acceptable water quality in the WMP once treated effluent is available for 4:1 dilution of tailings contact water. Figure 4 indicates that the cumulative net inflow volume can be managed below the MOWL by sharing the storage volume available in TMA Cell 2, TMA Cell 3 and the WMP, provided that treatment is available September 1, 2018. Under the average and 1:20 wet year scenario, water will need to be stored in TMA Cell 3 prior to the WTP coming online in September 2018. The timing of TMA Cell 3 storage becoming available and the WTP are critical items. Sufficient pumping infrastructure between TMA Cell 2, TMA Cell 3 and the WMP will be required to ensure the storage volumes can be fully utilized (especially in the 1:20 wet scenario).

13.0 CONCLUSIONS

The results of the analysis indicate that TMA Cell 2 and the WMP can be operated under a variety of climatic conditions. The analysis assumes an initial inventory of 2.0 Mm^3 of storage in the WMP, however should there be more water in the WMP on April 1, 2018 the WTP may be required earlier than September 2018. In such a case of a higher initial inventory in the WMP, no water from the Pinewood River should be taken in the spring of 2018. TMA Cell 3 must become available for water storage over the period of June 1 - September 1, 2018 prior to the commissioning of the WTP in September 2018.

14.0 RECOMMENDATIONS FOR TMA CELL 2 OPERATION

During the operating life of TMA Cell 2, reclaim water will be sourced from the WMP and TMA Cell 2. The Water Treatment Plant should be available in September 2018 to limit the volume of water in TMA Cell 2 in the event of above average precipitation conditions in 2018. Without the WTP, the ongoing tailings deposition would reduce the available water storage such that the Environmental Design Flood event may not be contained. Discharge from the WMP to the Pinewood River is not expected to be required until the spring of 2019.

The following water management strategy has been developed to maintain the pond volume in TMA Cell 2 below its maximum operating level by maximizing the use of available storage in other areas:

1. In the early months of TMA Cell 2 operations (up to July) excess water collected in TMA Cell 2 should be transferred to the WMP (Continuing this transfer longer is not suggested as this could increase the WMP volume close to its maximum operating level in the event of wet conditions).

2. Starting in July or August as required, excess water collected in TMA Cell 2 should be transferred to TMA Cell 3. For average conditions, this transfer would continue until about October, after which reclaim will control the TMA Cell 2 volume. For wet conditions, the transfer to TMA Cell 3 can continue until the available storage in TMA Cell 3 has been filled, expected around September.

3. Starting as early as September 2018 (in the event of wet conditions) or later (March for average conditions) excess water collected in TMA Cell 2 should be pumped to the WTP for water treatment, and the treated effluent transferred to the WMP for discharge once the water quality is acceptable (total WMP volume is above 5.0 Mm^3).

To implement this strategy, the following operating guidelines are suggested for TMA Cell 2 and the WMP during the operating life of TMA Cell 2:

- Water for mill reclaim should be taken from the WMP until the WMP volume is reduced to below 1.0 Mm^3, then shifted to TMA Cell 2. Sufficient pumping infrastructure should be installed to allow mill reclaim from either WMP or TMA Cell 2 for the duration of TMA Cell 2 operation.

- Pumping from the Pinewood River to the WMP should occur if the total combined storage in TMA Cell 2 and the WMP is less than 4 Mm^3, so ensure there is sufficient water for mill processing for the winter of 2018/2019.

- All pumped discharges from TMA Cell 2 (to the WMP, to the WTP, and to TMA Cell 3) to reduce the water level in TMA Cell 2 should be regulated and planned to start once the TMA Cell 2 pond volume increases to within approximately 800,000 m^3 of the MOWL. The

discharges should continue until TMA Cell 2 pond volume is lowered by about 400,000 m^3 (1,200,000 m^3 below the MOWL).

- Pumping infrastructure should be installed to allow for pumping at a rate of approximately 40,000 m^3/day between TMA Cell 2, 3 and the WMP even at low water levels. This will allow full utilization of the available storage volumes in TMA Cells 2, 3 and the WMP. In a wet year scenario it may also be necessary to pump directly from the WMP to TMA Cell 3, to reduce WMP volumes to below 1.0 Mm^3, prior to the implementation of the WTP.

- Effluent discharge of treated water from the WMP to the Pinewood River or treatment wetlands should only occur if the total storage in the WMP is above 5.0 Mm^3 (not anticipated during the life of TMA Cell 2). This effluent discharge strategy only applies to the first batch of discharge, as the 1.0 Mm^3 of residual contact water in the WMP requires dilution prior to discharge.

15.0 LIMITATIONS OF RESULTS

The applicability of the results of this assessment depend on the following conditions and assumptions:

- TMA Cell 2 will start impounding water on April 1, 2018;
- TMA Cell 3 will start impounding water on June 1, 2108, will be able to receive pumped inflows from TMA Cell 2 on July 1, 2108, and will reach its full storage capacity on September 1, 2018.
- Drainage areas collected and sent to TMA Cell 2 will be as described in this memo;
- The WMP will have 2.0 Mm^3 of water on April 1, 2018;
- Mill production will be at 100% for the 12-month life of TMA Cell 2; and
- Tailings properties in terms of the water storage volume available above tailings, and pore water losses, will be as described.

16.0 CLOSING REMARKS

This memorandum was prepared by Norman Schwartz, P.Eng., and reviewed by Mark Sullivan, P.Eng. Please do not hesitate to contact either individual should you have any questions regarding the information contained in this memorandum.

Notes

- WMP initial storage capacity of 5.0 Mm3 for mine contact water should be drawn down to 1.0 Mm3 prior to startup of WTP
- Cell 3 is closed off June 1, 2018 and storage becomes available at constant rate until completion Sept. 1, 2018

ATTACHMENT 1

Attachment 1 provides a more detailed discussion of the results of the water balance modelling and the water management schemes which were developed for average, 1:20 wet year, and 1:20 dry year conditions. Detailed graphs of water levels, pond volumes and pumping transfers for TMA Cell 2 and the WMP for average, wet and dry year conditions are provided as Figures 1.1 through 1.12.

- During an average year, it will be required to transfer water from TMA Cell 2 to the WMP in June 2018 to manage the volume increase in TMA Cell 2. In July and August 2018 this transfer should switch to TMA Cell 3 in order to limit the volume increase in the WMP. Reclaim can be taken from the WMP until the end of July, at which point the WMP is expected to be reduced below 1.0 Mm^3. At this point reclaim would switch to TMA Cell 2. Although it is assumed that the WTP will be available in September, it is expected that taking reclaim from TMA Cell 2 can control the TMA Cell 2 volume in an average year until spring 2019 when ongoing tailings deposition will reduce the available water storage capacity in TMA Cell 2, and discharge to the WTP will be required. The WMP volume will be reduced further, possibly as low as 0.5 Mm^3 due to ice formation, prior to the discharge of treated effluent from the WTP to the WMP. No discharge to the environment is required in the average year.

- During a 1:20 wet year, it will be required to transfer water from TMA Cell 2 to the WMP earlier, starting in May and continuing to June 2018, to manage the volume increase in TMA Cell 2. June should be the latest month to transfer to WMP in order to limit the volume increase in the WMP. July 2018 is when transfer to TMA Cell 3 should start. The latter should continue until September 2018, when TMA Cell 3 would be filled to its capacity. Once the WTP comes on line starting in September 2018, the TMA Cell 2 volume can be controlled by pumping TMA Cell 2 to the WTP. The availability of the WTP (and the supplemental storage in TMA Cell 3), is required for TMA Cell 2 to provide the required storage for the Environmental Design Flood (EDF) below the spillway invert. Reclaim for the 1:20 wet year is always taken from the WMP as the water volume in the WMP would remain above 1.0 Mm^3 (minimum volume of approximately 1.3 Mm^3 reached in the WMP prior to WTP commissioning, however additional storage is still available in TMA Cell 2 to allow WMP to be pumped down to approximately 1.0 Mm^3 storage. Sufficient pumping infrastructure should be available to readily pump between the WMP, TMA Cell 2 and TMA Cell 3 to fully utilize all available storage. At the end of March 2019, the water level in TMA Cell 2 should be below the MOWL, so the EDF event could be fully contained. No discharge to the environment is required in the 1:20 wet year, however discharge in the spring of 2019 (May) would be necessary.

- During a 1:20 dry year the WTP would not be required for the duration of TMA Cell 2 operation, since reclaim will switch from the WMP to TMA Cell 2 after June. This would will keep the water level in TMA Cell 2 significantly below the MOWL until March 2019. At that time the effect of ongoing tailings deposition will reduce the available water storage capacity significantly, however TMA Cell 3 will have sufficient capacity for storage of any excess volume. The results indicate that there is enough water to operate the mill through the winter of 2018/2019 in the 1:20 dry year, however the WMP may freeze solid, as there is less than 0.5 Mm^3, prior to the winter. All reclaim during the winter would be taken from

TMA Cell 2. The minimum volume of free water in TMA Cell 2 is approximately 0.5 Mm^3 in February of 2018, which is expected to be adequate to operate pumps and limit suspended solids. A transfer to TMA Cell 3 is shown in March 2019 (reducing the TMA Cell 2 volume to 0.25 Mm^3), however this water would likely be sent to the WTP for treatment to reduce the TMA Cell 2 volume.

The following Tables 1.1 and 1.2 provide annual summaries of input volumes, output volumes, and volumes of water transferred between the ponds for the three precipitation scenarios.

Table 1.1: Water Balance Summary for TMA Cell 2

		Average Year	1:20 Wet Year	1:20 Dry Year
SYSTEM INPUTS (m^3)				
	TMA Runoff	3,097,557	4,257,896	1,824,112
	MRP Runoff	1,596,192	2,194,122	939,977
	Open Pit Runoff	885,870	1,217,715	521,678
	Groundwater pumped from Open Pit	912,500	912,500	912,500
	TMA Cell 1 Runoff	468,684	644,252	276,002
	TMA Ice Melting	819,756	819,756	819,756
	Water in Tailings Slurry	8,678,284	8,678,284	8,678,284
SYSTEM OUTPUTS (m^3)

MNRF Comments on the Pre-Production OMS Manual and New Gold Responses on revision AG (October 2016)
&
ITRB Review Comments on Pre-Production Version (July 2017)

October 6, 2016
TC150321

Delivered by e-mail

Mr. Paul Hosford, Project Director
New Gold Inc.
Two Bentall Centre
Suite 1800 – 555 Burrard Street, Vancouver
British Columbia, Canada, V7X 1M9

Dear Mr. Hosford:

Re: Rainy River Project Development,
Operation, Maintenance and Surveillance Manual – Tailings and Water Management Structures
3098004-000000-A1-EMA-0001-00
Comments and Responses

Below please find the responses to comments received for the OMS / EPP from the MNRF:

1. *General*

   a. *Appendix C; tailings, heap leach and waste rock. Confirm the term heap leach.*

      Response:
      Appendix C is a New Gold's corporate policy document. Even though the policy applies to tailings, heap leach and waste rock facilities, heap leaching does not apply to this project. The text in section 1.6 describes that Heap Leaching is not applicable to the project.

   b. *Table 1-1 and 2-1 are specific to MNRF. NGD should ensure the OMS/EPP is circulated to the appropriate agencies*.

      Response:
      New Gold has no objections in sharing the OMS with other agencies and contacts at the MNDM will be added to Table 2-1.

   c. *Page 42 – Contingency. Section is incomplete.*

      Response:
      Relevant contingency measures have been added to Section 7.7.

www.amec.com

d. *Operations: Please confirm whether a stand-alone Operating Plan has been developed for the WMP. The operations plan should provide complete, clear and step by step instructions for operation of the pond. The current OMS is currently missing the following information with regard to operations:*

- *Instructions on routine and general operation of the pond, including maximum water levels permitted at each time of year.*

  Response:
  This is included in the WMP Fill Plan which is incorporated as an Appendix D in the OMS.

- *Max. and min. storage in the pond (in terms of volume AND elevation).*

  Response:
  This is included in the WMP Fill Plan which is incorporated as an Appendix D in the OMS.

- *Max/min inflows and outflows/discharge (Water quality objectives, reference MOECC's C of A),*

  Response:
  Information about inflows and discharge quantities are included in the WMP Fill Plan which is incorporated as an Appendix in the OMS. Any discharge will meet the limits as described in the ECA # 5781-9VJQ2J.

- *Stage-storage curves.*

  Response:
  This is included in the WMP Fill Plan which is incorporated as an Appendix D in the OMS.

- *Other pond constraints.*

  Response:
  This is included in the WMP Fill Plan which is incorporated as Appendix D in the OMS.

- *Upstream and downstream constraints (in terms of spillway releases).*

  Response:
  WMP see Table 3-3 of the OMS.

- *Operation of structure in emergency situations/flood operating procedures*

  Response:
  See section 7.0 of the OMS.

- *Ice and debris handling.*

  Response:
  Not applicable during pre-production phase for the WMP is filling. For other channels debris will be removed.

- *Information on flood forecasting.*

  Response:
  Information on managing flood scenarios is provided in Section 3.0.

2. *Maintenance*:

   Provide more details on roles and responsibilities for emergency, major and minor maintenance.

   Response:
   Section 5.0 of the OMS describes the overall maintenance however, the details on responsibilities for maintenance and other tasks are discussed in section 2.0 Roles and Responsibilities of the OMS.

3. Section 1.4

   Provide more detail on the annual review of the OMS manual, including:

   Describe the process by which necessary changes will be evaluated.

   Response:
   This manual will be updated to the production version prior to the annual review process and this will be evaluated at that time.

   Who will be designated to evaluate and update the OMS?

   Response:
   Dave Hall, Mill Manager will be responsible for evaluating and updating the OMS.
   Note that working draft manuals must be made available in advance of commissioning any new system.
   Copies of the OMS will be made available at the site and to MNRF.

4. Section 2.4

   Complete the contact list in table 2-1 with all known information.

   Response:
   Table 2-1 has been updated.

5. Section 2.6

   Add that changes, modifications, alterations or improvements to the design and operations of the systems shall be screened by the MNRF.

   Response:
   Requested text has been added to section 2.6.

   *Working draft manuals must be made available **in advance of** any changes or start of operations, not just "within 90 days"*

   Response:
   Text revised accordingly.

   Provide clarity to define what "important events" trigger an update to the OMS manual (i.e. the important events listed in table 6-2).

   Response:
   Text revised accordingly.

6. Section 3.0

   Provide most up-to-date site layout and not conceptual plan.

   Response:
   The site plan/general arrangement is now current.

7. Section 3.3

   *Add "Subject to **MNRF** approvals…" in discussion of WMP filling during the pre-production phase.*

   Response:
   Text added as requested.

8. Section 6 (page 32)

   States that the surveillance plan is "conceptual".

   Response:
   The word conceptual has been removed.

   Cover letter recommends that Standard Operating procedures should be developed for dam inspections for daily, weekly and monthly inspections. These procedures should be developed PRIOR to any operation of the WMP.

   Response:
   SOPs will be developed and implemented prior to production.

9. Section 6.1.2

   Clarify frequency of inspections. Section 6.1.2 sets bi-weekly standard which conflicts with table 6-1 which indicates "at least once a week"

   Response:
   Text revised.

10. Section 7.0 – Emergency Response

    It is unclear which section in the EPRP relates directly to dam failure as outlined in this section.

    Response:
    A new section 12.0 - Environmental Risks and Responses has been created in the updated EPRP manual.

Comments on EPRP:

11. General

    a) *Provide detail on environmental concerns and response associated with:*

    - *Open Pit Failure*
    - *Stockpile Slope Failure*
    - *Tailings Dam Failure*
    - *Pond Dam Failure*
    - *Watercourse Diversion Failure*
    - *Tailings Pipeline failures*

    Response:
    A new section 12.0 has been added to the EPRP that addresses environmental concerns and responses with the facilities as requested above.

    b) *Please provide detail relating to the management of wildlife related emergencies (i.e. wolf, bear) or provide reference to plans already in place.*

    Response:
    Included reference to wildlife attack in EPRP Manual, Part 2 Section 1.0 Serious Injuries & Fatalities

1. PART I

   Section 3.2 – Include LRIA in the list of Legislation and Industry Standards

   Response:
   Updated Section 3.2 of the EPRP to include LRIA

Section 5.4 – Provide detail on the process that ensures the regular review of the EPRP manual.

- *Describe the process by which necessary changes will be evaluated*
- *Who will be designated to evaluate and update the EPRP?*

Response:
Revised and updated section 5.4

2. PART II

Section 5.1.2 – Provide more detail (i.e. actions, trigger levels) to do with Winter Wind Chill

Response:
Wind Chill calculation table and Wind Chill Hazard tables from Environment Canada are now included in EPRP

Section 9.6 – Update table 14 – reporting guidelines to include tailings and other contaminated water

Response:
Table 14 in Section 9.6 has been updated as follows:

a) Tailings – Report all unplanned releases that escape secondary containment.
b) Contaminated Water - Report all unplanned releases that escape secondary containment.

We trust this letter provides sufficient detail for your present needs. Do not hesitate to contact us if you need any further clarifications.

Yours sincerely,
Amec Foster Wheeler Environment & Infrastructure

Re: Review of the Operations, Maintenance and Surveillance Manual for Rainy River Project

Dear Sir:

The ITRB was asked by Ms Andrea St-Pierre in an email dated July 27, 2017 to comment on the OMS manual for the site tailings and surface water control structures. This is an interim document meant to describe primarily the operation, maintenance, and surveillance of the surface water control dams and ditches that are complete or near complete. The starter dams for the tailings operation are not yet complete so the OMS procedures cannot be described. Preparation of an OMS manual at the construction stage of a mining project is a difficult undertaking as the structures themselves evolve at during writing of the document. We commend the Rainy River project(RRP) for this difficult undertaking.

The RRP recognizes that the OMS manual will have to be updated as the structures are completed and come into operation. Some of the report sections in the OMS can be kept while others will have to be completely rewritten for the next update. In the current document, the date of submission of the document, July 2017, is well after the status description of some structures. This should be clarified in the document by stating that "this document describes the status of the project at the end of May, 2017 (for instance)" in the Introduction.

The ITRB considers that the OMS document needs to be updated before submission to the MNRF.

- For example, the Emergency Response Contact list requires updating to reflect changes in personnel, and a commitment to the environment is signed by a president long departed;
- The manual contains a description of the geology that omits the presence of high plastic clay tills (that is described a silt) , with low residual strength and high pore pressure response. The ITRB considers this to be misleading and recommends updating;
- The OMS plan provides a general outline of procedures to be followed but note the absence of trigger levels and details. The OMS plan currently provides rough guidelines such as 'when there is a big rainfall… check the dam.' or 'When is a significant change in the readings of a

piezometer, check the instrument then report to EOR' etc but there is no clarity on what constitutes significant or big.

- Section 2 does not state who updates and checks the OMS. Clearly, the Mill Manager is responsible for this but would not normally do this personally. Normally, the site geotechnical engineer would do this work.
- Section 2.5 , bottom of Page 8, states that the OMS will be "screened" by the MNRF. This is unusual. Normally regulatory agencies receive submissions for comment, not screening.

The ITRB would like to be appraised of the changes made and be provided with a summary of instrument readings versus pond level with time at the next ITRB meeting in the fall.
With the above proposed changes included, The ITRB can support the OMS plan.

Yours truly,
On behalf of the ITRB

Senior Project Advisor

EXECUTIVE SUMMARY

The Rainy River Project (RRP), operated by New Gold Inc., is an open pit and underground gold mine located approximately 65 km northwest of Fort Frances, and approximately 420 km west of Thunder Bay, Ontario. Commercial production started in late 2017 and ore is milled and refined on site to produce doré bars at an estimated annual rate of approximately 325,000 ounces. Mill tailings are treated to destroy cyanide and conveyed to the RRP tailings management area (TMA). Reclaimed water from the TMA is returned to the mill for re-use. Excess water is treated in a polishing pond prior to discharge into a constructed wetland at Loslo Creek or by direct pipeline to the Pinewood River downstream of McCallum Creek. The constructed wetland is the primary effluent discharge path. The pipeline is available to discharge excess effluent if necessary in order to maintain wetland water retention time and reduce wetland erosion. Under average effluent discharge rates and Pinewood River flow, the effluent concentration in the Pinewood River is calculated to be up to approximately 14% after mixing.

Sublethal toxicity tests conducted on grab samples of RRP final effluent at Final Discharge Point 2 (FDP2) and Final Discharge Point 3 (FDP3) over the Phase 1 EEM period (2016 to 2017) indicated that effluent was generally of high quality with the lowest reported effects occurring at effluent concentrations of 37% and 95% for FDP2 and FDP3 respectively. Overall, sublethal toxicity data indicate good effluent quality and the observed responses occurred at effluent concentrations well above those expected in the receiving environment.

Water quality of the Pinewood River downstream of RRP was only moderately influenced by effluent discharge. Influence of RRP effluent was evident in higher conductivity, hardness, calcium, potassium, and sodium in the effluent-exposed area relative to upstream. Nitrite was elevated in the effluent-exposed area compared to both the reference area and the water quality guideline for the protection of aquatic life on one occasion in 2016. Additionally, aluminum and iron were the only other parameters measured that did not meet water quality guidelines for the protection of aquatic life, however, this occurred at both the effluent-exposed and reference areas, indicating that these substances are naturally elevated in this area. Overall, water quality data collected during the EEM study were consistent with the routine monitoring data and indicated a detectable, but minor, effect of RRP effluent on water quality of the Pinewood River, confirmed during the April and September field studies on the basis of measured *in situ* measurements.

The inorganic sediment fraction was composed predominantly of silt (37-69%) and clay (25-41%), with some sand (2-31%). There were significant differences between the effluent-exposed and reference area sediments on the basis of total organic carbon, as well as the silt and clay fractions, with significantly more TOC and silt in the effluent-exposed area, and significantly less clay.

Sediment concentrations of chromium and nickel were elevated in both the effluent-exposed and reference areas, compared to Provincial Sediment Quality Guideline (PSWQG) Lowest Effect Levels (LEL). Additionally, effluent-exposed sediment concentrations of manganese and phosphorus were elevated compared to reference area concentrations and the PSQG LEL. Total organic carbon (TOC) was above the PSQG LEL in both areas. There were no Severe Effects Level (SEL) exceedances except for total Kjeldahl nitrogen (TKN) at the effluent-exposed area; TKN was greater than LEL at the reference area.

The benthic invertebrate community survey showed only subtle differences between the effluent-exposed area and the reference area. At the family level of taxonomic resolution, the benthic invertebrate community of the Pinewood River effluent-exposed area did not differ significantly from the Sturgeon Creek reference area on the basis of density, richness, or Simpson's E. The Bray-Curtis distance was significantly higher at the exposed area of Pinewood River compared to the reference area of Sturgeon Creek, likely due to a difference in the habitat between the two areas rather than an effluent related influence.

No major differences in fish community composition were observed between the two areas, although the effluent-exposed area on Pinewood River supported a higher species diversity. Female brook stickleback downstream of the RRP differed significantly from reference female brook stickleback based on relative gonad size, relative liver size, and body condition, with the magnitude of differences exceeding the applicable critical effect sizes (CES). A similar pattern was observed for effluent-exposed female central mudminnow, with significant differences in relative gonad size, relative liver size, and body condition, although only relative gonad size exceeded the applicable CES. Effluent-exposed male brook stickleback differed significantly from males captured at the Sturgeon Creek reference based on larger relative liver size and body condition, with the magnitude of difference outside of the applicable CES for both endpoints. Similarly, male effluent-exposed central mudminnow showed the same pattern as the male brook stickleback (larger relative liver size and body condition) in terms of significance and magnitude of difference outside of applicable CES.

Based on the findings of the Phase 1 RRP EEM study conducted in April and September 2017, it is recommended that the mine implements the Phase 2 EEM biological study ("periodic monitoring – surveillance") three years after Phase 1.

1 INTRODUCTION

1.1 Site Description

New Gold Inc. owns the Rainy River Project (RRP), located in northwestern Ontario in the Township of Chapple and District of Rainy River, approximately 65 km northwest of Fort Frances, and approximately 420 km west of Thunder Bay (Figure 1.1). The RRP is located within the Pinewood River watershed. The Pinewood River flows past the RRP and drains into the Rainy River approximately 37 km downstream.

Earliest exploration of the RRP began in 1967. Rainy River Resources Ltd. acquired the project in 2005 and began conducting baseline studies in 2008. The RRP was acquired by New Gold Inc. in 2013 and an Environmental Assessment (EA) report was submitted in 2014 (AMEC 2014). Site construction began following provincial and federal EA approvals in 2015. Upon completion, the RRP site construction will include an open pit mine, an underground mine, ore storage facilities, a process plant, a Tailings Management Area (TMA), watercourse diversions, site drainage works, a fuel tank farm, explosives manufacturing facilities, and explosives storage facilities (Figure 1.2). Mine commissioning occurred in September 2017.

The RRP is expected to sustain mining operations for approximately 16 years, with an anticipated ore production capacity of 27,000 tonnes per day (tpd) as well as an anticipated milling capacity of 21,000 tpd (CEAA 2015).

1.2 Effluent Characteristics

Under the MMER, RRP was required to conduct effluent characterization, sublethal toxicity testing, and water quality monitoring starting not later than six months after the day on which the mine became subject to the MMER. RRP became subject to the MMER on September 17th, 2015 and thus was required to start monitoring on March 17th, 2016.

Treated effluent from the RRP's s seven discharges has complied with the MMER (Table 1.1), with only three exceptions during the Phase 1 EEM time period (2016 to 2017). Three incidences of elevated Total Suspended Solids (TSS) occurred, on April 15, 2016 at FDP2 (42 mg/L), September 28, 2016 at FDP6 (31 mg/L), and January 28, 2017 at FDP7 (39 mg/L; Table 1.1).

Effluent discharge is intermittent for all seven Final Discharge Point (FDP)s usually related to increased precipitation, this was especially relevant in 2016 as this was during the construction phase, so the mine pits needed periodic pumping (Figure 1.3). The nature of this unpredictable discharge schedule meant that effluent characterization could not always occur a minimum of 30 days apart (Table 1.1). The mean annual discharge in 2017 was increased compared to 2015 or 2016 for five of the seven FDPs (Table 1.2). However, two of the FDPs (FDP 6 and 7), had

RRP Mine effluent was usually non-lethal (< 50% mortality in 100% effluent) to *Daphnia magna* and rainbow trout during the Phase 1 EEM acute toxicity bioassay tests, however there were two failed tests due to rainbow trout mortalities (Table 1.3). New Gold retained Minnow to perform a preliminary review of the effluent chemistry data associated with toxicity testing at RRP following these rainbow trout (*Oncorhynchus mykiss*) mortality events (ranging from 10 to 90% mortality). Note that 10% mortality is a level acceptable in test controls (Environment Canada 2007a). The review of effluent chemistry results identified ammonia as the most likely toxicant.

For the review, the effluent chemistry data associated with mortality events were first screened against guidelines to identify any possible toxicants. Effluent concentrations consistently achieved water quality guidelines for the protection of aquatic life and therefore this initial screening did not identify any toxicants. However, in Minnow's experience, ammonia is often a contributor to acute toxicity in mine effluents (due to blasting using ammonium nitrate). Furthermore, fish mortalities in laboratory tests of mine effluent are often due to changes in ammonia toxicity over the duration of the test.

The toxicity of ammonia in aqueous solutions is dependent on the equilibrium between the un-ionized (NH_3) and ionized (NH_4^+) species. The speciation of ammonia in water is largely determined by pH and temperature, with higher proportions of the toxic un-ionized species being associated with higher pH and higher temperature (CCME 2010). Within a bioassay test, the experimental pH and temperature of the effluent solution can be different from *in situ* conditions, and may change over the duration of the 96 hour test. The toxicity of ammonia (i.e., proportion of un-ionized ammonia) may increase during the test due to a progressive increase in pH as a

Denotes a failed acute toxicity result (> 50%)

result of aeration and the associated decline in dissolved CO_2 (Environment Canada 2007a). As expected, the pH of RRP bioassay test solutions increased over the test duration.

Un-ionized ammonia concentrations in bioassay tests were calculated using total ammonia concentrations as well as the pH and temperature for three condition scenarios: (1) *in situ* field conditions, (2) the initial bioassay conditions at the start of the test, and (3) the final bioassay conditions at the end of the test. Calculation of un-ionized ammonia for these three scenarios indicated that, over the duration of the bioassay test, pH levels in RRP bioassay tests increase to levels where concentrations of un-ionized ammonia exceed 96 hour acute mortality LC_{50} levels for juvenile rainbow trout (i.e., 0.4 - 0.673 mg/L HN_3; Figure 1.4; CCME 2010, USEPA 1984), but this would not occur *in situ* with the conditions naturally found in the Pinewood River.

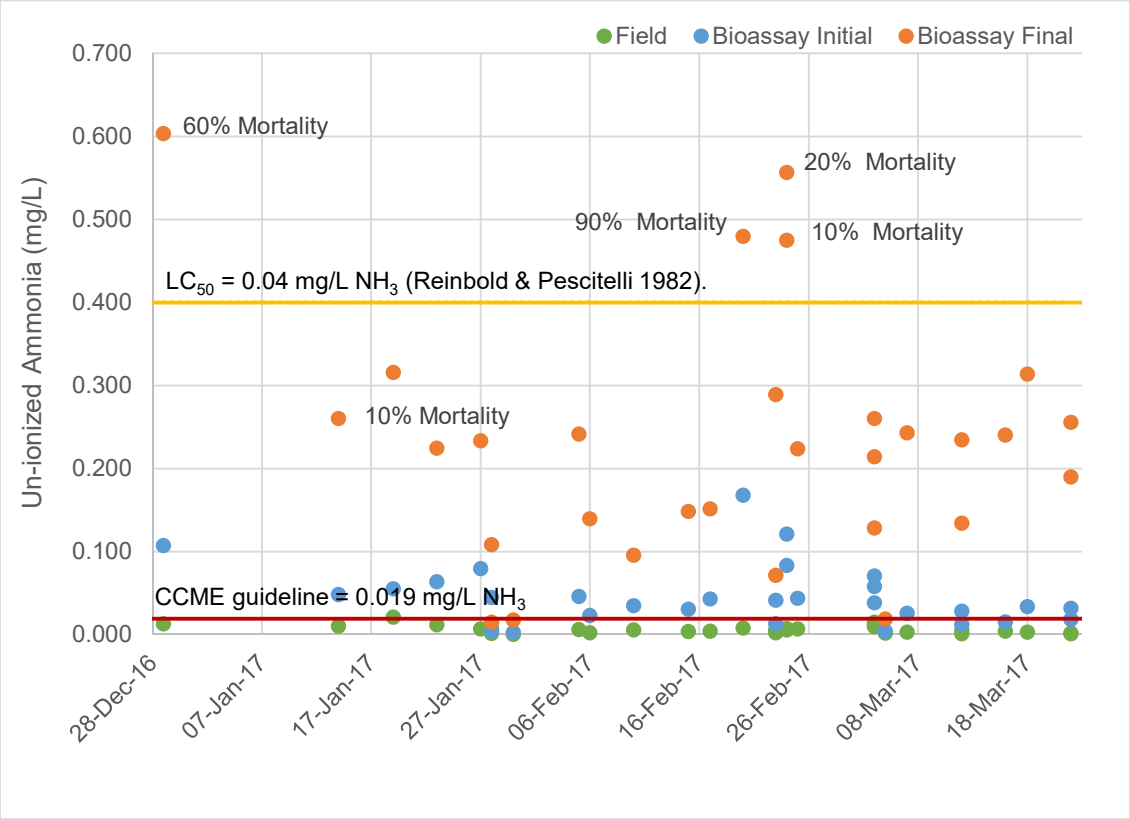

Figure 1.4: Calculated Un-ionized Ammonia Concentrations in Bioassay Test Solutions and Corresponding Mortality Events

This pH drift under test conditions can be controlled in the laboratory. The Environment Canada guidance document indicates that, if effluent samples contain an appreciable quantity of ammonia or other constituent whose toxicity is highly pH-dependent, and concern exists about pH drift

during testing and its contribution to sample toxicity, a second (concurrent) test may be conducted. This second test could be undertaken using various means (e.g., oxygenating rather than aerating solutions, addition of CO_2 to test solutions or enclosed atmospheres above the solutions, testing solutions in sealed containers with oxygen atmospheres) to reduce or prevent pH drift during the test (Environment Canada 2007a).

Therefore, it was recommend that RRP speak to their bioassay laboratory about running a second (concurrent) pH-controlled test for future acute toxicity tests.

Overall the effluent from RRP is of high quality and should have minimal impact on the receiving environment, especially at calculated concentrations found within the Pinewood River (~14% total volume; Minnow 2016).

1.3 Receiving Environment Characteristics

The Pinewood River is the secondary receiver of the RRP's effluent discharge from Process Plant Site, South Pond, Sump 3, and Sump 4, as well as from PPOP via Clark Creek. Currently, all discharge is controlled by pumping. Fish and benthic invertebrate sampling was conducted downstream of the primary FDP, at water quality monitoring station SW22A and downstream, with specific locations based on accessibility and habitat conditions. The effluent-exposed biological monitoring area will be referred to as PinR-EXP (Figure 1.2). SW22A is approximately 5 km downstream of the confluence of West Creek (which receives effluent from the current primary FDP) and the Pinewood River (2.9 km downstream in a direct line). SW22A is also approximately 150 m downstream of Loslo Creek, which will receive effluent discharge from the TMA once the mine is fully operational (Figure 1.2).

The Pinewood River originates at the outlet of Pinewood Lake (24.2 km upstream of SW22A, or approximately 13.5 km east overland) and flows southwest into the Rainy River, which then drains into the southern end of Lake of the Woods. The Rainy River forms part of the international border between Ontario, Canada and Minnesota, United States. Total length of the main stem of the Pinewood River is 75 km. At the confluence of the Pinewood River and the Rainy River, the Pinewood River drains a watershed of approximately 576 km^2. Flow in the Pinewood River is highly variable, with highest flows occurring during freshet and low flows during winter (Government of Canada 2016). The Pinewood River has a mean annual flow of 4.60 m^3/s at the confluence with Rainy River. The mean annual flows at the WSC station 05PC023 and the water quality monitoring station SW22A are and 1.85 m^3/s and 0.83 m^3/s, respectively (Government of Canada 2016, SDI 2015).

The Pinewood River is a relatively shallow, meandering river, with a low gradient (average < 0.1%; KCB 2011). The substrate is predominantly fines, clay, silt, and detritus, with

some sand and, in some areas, sparse gravel, and boulder (AMEC 2014). Average wetted width varies along the river, from 1.5 m to as much as approximately 40 m at the widest part near the confluence with the Rainy River (AMEC 2012, KCB 2011). Near the RRP site, wetted width is generally around 10 m, while the depths were 0.3 to 1 m in July (AMEC 2012; KCB 2011). Stream cover is mostly provided by overgrowth, and to some extent large woody debris.

The effluent-exposed area of the Pinewood River is generally comprised of flat morphology with some pools (AMEC 2014) and contains two main habitat types. The first habitat type has narrower floodplain widths, with forested riparian vegetation extending close to the channel edge (AMEC 2014). Aquatic vegetation is dominated by red-head pondweed (*Potamogeton richardsonii*) and hornwort coontail (*Ceratophyllum demersum*; AMEC 2014). The second main habitat type has relatively open channels, with maximum floodplain widths of 50 m and a riparian zone of sedge species (Cyperaceae), speckled alder (*Alnus incana*), and willow species (*Salix* sp.; AMEC 2014). Aquatic vegetation is dominated by yellow cowlily (*Nuphar lutea*), broadleaf arrowhead (*Sagittaria latifolia*), tape grass (*Vallisneria spiralis*), and hornwort coontail. Mixed forest species associated with the upper Pinewood River (effluent-exposed area) included: black spruce (*Picea mariana*), larch (*Larix* sp.), balsam poplar (*Populus balsamiferous*), white elm (*Ulmus americana*), and white birch (*Betula papyrifera*; AMEC 2014). Beaver dams are present in many locations in the Pinewood River and, although not considered permanent barriers to fish movement, may act as obstacles, particularly to larger-bodied fish (AMEC 2014). In 2010, beaver dams were observed at approximately 1 km, 1.8 km, and 3.7 km downstream of SW22A (i.e., potentially downstream of or within the PinR-EXP area; KCB 2011). Manmade water crossings along the Pinewood River have been observed to allow for sufficient river flow and thus did not present as a barrier to fish movement (AMEC 2014).

In the lower Pinewood River, widths and depths increase as the river approaches the Rainy River, reaching maximum bankfull depths of 4.5 m (AMEC 2014). Here the substrate, although still predominantly clay and fines, has a larger proportion of coble, gravel, and boulder (AMEC 2014). The riparian zone is comprised of mixed forest including black spruce, larch, balsam poplar, white birch, and white elm (AMEC 2014).

Gravel and cobble shoals provide fish spawning and nursery habitat for numerous species, including walleye. This type of spawning habitat has only been identified in the lower Pinewood River (downstream of the confluence with McCallum Creek; AMEC 2014). Spawning habitat for northern pike and yellow perch is shallow vegetation, particularly the heavily vegetated floodplains of streams or lakes (Holm et al. 2010). This type of habitat is abundant in the upper Pinewood River (upstream of McCallum Creek) and its upper tributaries (AMEC 2014), in part as a result of flooding by beaver ponds.

1.4 Summary of the Approved Phase 1 Design

The Study Design for the Phase 1 EEM was submitted to Environment and Climate Change Canada (ECCC) in September 2016 (Minnow 2016).

1.5 Report Organization

Methods of sample collection, sample analysis, and data analysis during the Phase 1 EEM study for RRP are presented in Section 2. Section 3 presents a summary of the effluent sub-lethal toxicity test data collected to date. Supporting field measures and water quality data are presented in Section 4. Sediment quality data are presented in Section 5 and the benthic invertebrate community survey results are presented in Section 6. Section 7 presents the findings of the fish survey and the conclusions of the RRP Phase 1 EEM and recommendations for the next Phase are provided in Section 8. All the references cited throughout this document are listed in Section 9.

2 METHODS

2.1 Overview

The RRP Phase 1 EEM consisted of effluent sublethal toxicity testing, water quality monitoring, sediment quality monitoring, benthic invertebrate community monitoring and fish population monitoring. RRP conducts semi-annual sublethal toxicity testing of its primary final effluent and monitors water quality in effluent-exposed and reference areas a minimum of four times per year in accordance with EEM requirements (Environment Canada 2012) and the Environmental Compliance Approval (No. 5781-9VJQ2J) monitoring requirements for the Pinewood River. Fish community monitoring was conducted from April 21st to 25th, 2017 and the benthic invertebrate community monitoring was completed from September 13th to 17th, 2017. This monitoring, supported by a number of field measures and observations, was undertaken in effluent-exposed Pinewood River and the upstream Pinewood River and Sturgeon Creek reference areas (Figure 2.1).

2.2 Effluent Sublethal Toxicity

Sublethal toxicity tests were conducted on effluent from the RRP primary FDPs. Samples were collected into labelled HDPE (High Density Polyethylene) containers. Following collections, samples were put on ice inside coolers and shipped to AquaTox Testing and Consulting Inc. in Guelph, Ontario. Sample arrival time, temperature, dissolved oxygen, conductivity, pH and hardness were recorded upon arrival at the laboratory, and any unusual characteristics were also noted.

Sublethal toxicity tests were conducted on fathead minnow (*Pimephales promelas*; 7-d survival and growth test), a cladoceran invertebrate (*Ceriodaphnia dubia*; 7-d survival and reproduction test), an algae (*Psuedokirchneriella subcapitata*; formerly referred to as *Selenastrum capricornutum*; 3-d inhibition test) and duckweed (*Lemna minor*; 7-d growth inhibition test) using standard test methods (i.e., Environment Canada 2011, 2007b,c,d). For fathead minnow and *C. dubia* chronic toxicity tests, LC_{50} (i.e., lethal concentration to 50% of test organisms) was calculated from the mortality data by the laboratory (e.g., Stephan 1977). Chronic toxicity test IC_{25} (inhibitory concentration that reduced larval fathead minnow growth by 25%, reduced the number of *C. dubia* neonates produced by 25%, inhibited *P. subcapitata* and *L. minor* growth and/or frond production by 25%) values were calculated from the growth or reproduction data. Reference toxicant testing was employed to ensure that all test systems met protocol criteria during effluent testing. All IC_{25} data were derived by the toxicity laboratory using linear interpolation aided by Comprehensive Environmental Toxicity Information System (CETIS) software (Tidepool Scientific Software, McKinleyville, CA). Sublethal toxicity data were

subsequently reported to Environment Canada as part of RRP annual reporting and have been summarized in this report.

2.3 Receiving Water Quality

In accordance with the approved Study Design, routine receiving environment water sampling was conducted by the mine at the Pinewood River effluent-exposed area (SW22A) and a Pinewood River reference area upstream of the RRP (SW20; Figure 2.1). Water sampling for the biological survey was undertaken at the Pinewood River effluent-exposed area (PinR-EXP), and the Sturgeon Creek reference area (StuC-REF) during both the spring and fall surveys. This included an assessment of chemical parameters as well as supporting measures.

2.3.1 Sample Collection and Laboratory Analysis

Routine receiving water samples were collected at least four times per year at areas designated as reference (SW20) and effluent-exposed area (SW22A) to meet the EEM monitoring requirements (Figure 1.2). Routine water quality samples were collected at arm's length below the water surface to avoid floating material and facing upstream to avoid any potential influence of the individual collecting the sample. Samples were collected into pre-labelled and pre-preserved (if required) bottles provided by ALS Thunder Bay laboratory. Immediately after sampling, the samples were placed into coolers on ice for transport to the mine environmental laboratory for immediate shipment to ALS Thunder Bay. In the event that the samples were not shipped immediately, they were placed in a refrigerator at the mine environmental laboratory for shipment the next day. Analytes included those required under EEM: hardness, alkalinity, aluminum, arsenic, cadmium, copper, iron, lead, mercury, molybdenum, nickel, selenium, zinc, conductivity, total suspended solids, ammonia, nitrate, pH, cyanide, and radium-226 (Environment Canada 2012).

In accordance with the approved Study Design, water quality samples were collected at each of the study areas (Pinewood River effluent-exposed area and Sturgeon Creek reference) during the biological sampling in April and September 2017 (Figure 2.1). These water quality samples were collected as described above and were shipped the day after collection to ALS Environmental in Thunder Bay, Ontario for analysis of the EEM analytes listed above. Field duplicates were sampled to permit assessment of field precision (see Appendix B).

2.3.2 Supporting Measures

A number of environmental variables were monitored to support the EEM. The location of each sample and each fishing effort was recorded using a Geographic Position System (GPS) with coordinates recorded in latitudes and longitudes (degrees, minutes and seconds to one-tenth of a second using the North American Datum of 1983). Field-based measurements were collected

at all ten benthic invertebrate community stations and at the fish sampling areas. These included pH, dissolved oxygen, specific conductance, and temperature that were measured using a YSI 556 MPS (Multiprobe System) equipped with a multi-parameter Sonde. In addition, station depth, sediment texture, sediment odour and presence of plants or algae were recorded for each station. Sediment samples were also collected for chemical analyses (see Section 2.4). All observations associated with the sampling station or the samples were recorded on field sheets.

2.3.3 Data Analysis

All water quality data were evaluated by qualitative comparison of concentrations among areas (i.e., comparison of concentrations at the effluent-exposed area to reference area) and by comparison to water quality objectives for the protection of aquatic life. Provincial Water Quality Objectives (PWQO; OMOEE 1994) and Canadian Water Quality Guidelines (CWQG; CCME 2017) were both considered in the evaluation of water quality data for the RRP. Supporting measures were also statistically compared using Studentized T-test comparisons based on assumptions of normality and homogeneity of variance.

2.4 Sediment Quality

In accordance with the approved Study Design, sediment sampling was undertaken at all benthic invertebrate community sampling stations in both the effluent-exposed area (PinR-EXP) and reference (StuC-REF) areas (Figure 2.1). This included an assessment of physical and chemical parameters as well as supporting measures.

2.4.1 Sample Collection

Sediment samples were collected for analyses using a stainless steel Petite Ponar sampler (0.023 m^2 sampling area). A composite sample was created at each station by collecting the top five centimetres of surficial sediment from each of three acceptable Petite Ponar grabs (i.e., full to each edge of sampler) into a plastic tub. The composite sample was homogenized before being spooned (using a stainless steel spoon) directly into polyethylene bags. The top 5 cm was selected because it is the fraction in which most benthic fauna reside. Details about samples (e.g., sample penetration, depth, substrate characteristics) were recorded on field sheets. One duplicate sample was also assessed for quality assurance (see Appendix B).

Immediately after collection, samples were placed in a cooler on ice, and later placed in a refrigerator at the mine environmental laboratory at approximately 4 °C until submission for analysis. Sediment samples were submitted to ALS Environmental, Thunder Bay, Ontario for

analysis of total organic carbon (TOC), particle size[1], total Kjeldahl nitrogen (TKN), total phosphorus, and metals.

Additional supporting sediment measurements and observations collected at all benthic invertebrate monitoring stations included sediment texture and colour, and presence of algae or plants on or in the sediment.

2.4.2 Data Evaluation

The sediment quality data for the Pinewood River effluent-exposed area was evaluated relative to: 1) concentrations measured at the reference area, and 2) applicable Provincial Sediment Quality Guidelines (PSQG). PSQG are numerical criteria that are protective of sediment-dwelling organisms based on long-term exposure (OMOE 1993). The PSQG include lowest effect level (LEL) and severe effect level (SEL) values. LEL is defined as a concentration that can be tolerated by the majority of benthic organisms (i.e., at least 90-95% of species) and reflects sediments that can be considered clean to moderately polluted (OMOE 1993). The SEL is the concentration at which pronounced disturbance of the benthic community (i.e., 90-95% of benthic species) can be expected (OMOE 1993) and is typically about five times higher than the LEL. However, natural background concentrations, particularly in mineralized areas of the Canadian Shield, can be higher than LELs for many substances. Therefore, sediment concentrations at the EEM sampling stations were compared to both the PSQG LEL and SEL.

Principal component analysis (PCA) was also used to assist with the interpretation of general trends and patterns of variability in the sediment quality data among study areas. Data were screened to ensure that any variables with no variation (i.e., all less than detect) were removed from the data matrix. Principal component axes were then generated from the correlation matrix of the original sediment quality variables. PCA scores for each station were subsequently plotted and used as summary variables to test for differences among study areas using ANOVA with post-hoc comparisons as well as the correlation analysis.

2.5 Benthic Invertebrate Community Survey

In accordance with the approved study design, benthic invertebrate sampling was undertaken in the Pinewood River effluent-exposed area and Sturgeon Creek reference area (Figure 2.1). Target sampling station characteristics included a depth of approximately 1 m, bottom water velocity of less than 0.02 m/s and fine sediment with little to no gravel.

[1] Particle size determination was based on the Wentworth scale. Prior to particle size analysis, organic content was burned off (loss on ignition) to eliminate any chance of misclassification of small organic debris.

2.5.1 Sample Collection

Benthic invertebrate samples were collected using a steel petite-Ponar sampler (15.24 cm x 15.24 cm). Five stations were sampled in each area, at a minimum of three bankfull widths apart, to provide adequate statistical power to detect differences of +/- two standard deviation at an α and β of 0.10 which is consistent with EEM guidance (Environment Canada 2012). One sample was collected at each station and was composed of a three-grab composite (0.0697 m^2 of bottom area in total), to ensure each sample was representative of the station. Upon retrieval, all samples were closely examined to ensure that only high quality, comparable samples were retained (based on factors such as particle size, organic matter, presence, or absence of plants or algae). Each grab was placed into a tub to evaluate whether the grab was complete (i.e., that the grab captured the surface material and was full to each edge) and to evaluate the depth to which the grab penetrated. Unacceptable grabs were discarded. If the grab was acceptable, the Ponar was rinsed into the tub to ensure complete removal of all material. The sample was then placed into a 500 µm mesh sieve bag and sieved free of material less than 500 µm in diameter. Sampling was repeated until three acceptable grabs were collected. Details about each acceptable grab were recorded on field sheets. The retained sample from the three composited grabs was carefully transferred to one or more labelled 2-L wide mouth plastic jars using a stainless steel spoon and wash bottle while working over a plastic tub to avoid any potential loss of organisms. Any organisms still adhering to the sieve bag were removed with tweezers and added to the sample. All samples were labelled internally (using wooden sticks) and externally with the station number, area identifier, Minnow project number, date and field personnel in order to ensure correct identification at the laboratory. Samples were preserved with buffered formalin solution to achieve a nominal concentration of 10%. Supporting measures (GPS coordinates, station depth, water quality, and sediment quality) were collected at each benthic station as previously described.

2.5.2 Sample Processing

All benthic invertebrate samples were shipped to Zaranko Environmental Assessment Services (ZEAS), Nobleton, Ontario. Upon arrival at the laboratory, each benthic invertebrate sample was inspected to verify adequate preservation and a biological stain was added to improve sorting efficiency. Prior to sorting, benthic samples were washed free of formalin in a 500 µm sieve under well-ventilated conditions. Samples were then examined by a technician under a stereomicroscope at a magnification of at least ten times. All benthic organisms were removed from the sample debris and placed into vials containing 70% ethanol. A senior taxonomist then enumerated and identified the benthic organisms to the lowest practical level (typically genus or species) utilizing the most up-to-date taxonomic keys. Following identification, representative

specimens of each species were preserved in 75% ethanol (with 3% glycerol) in separately labelled vials to form a voucher collection.

Quality assurance/quality control (QA/QC) for benthic laboratory operations was conducted as recommended by Environment Canada (Environment Canada 2013, Glozier et al. 2002; Appendix B). Comparisons of fractions sorted were assessed for 10% of samples to verify that sub-sampling precision was within 20%. In addition, 10% of samples were re-sorted to verify that less than 10% of total organisms were missed (Environment Canada 2012). See Appendix B for full QA/QC analysis.

2.5.3 Data Analysis

Benthic invertebrate communities were evaluated at the Family Level [FL][2] using summary metrics of mean taxon richness, mean invertebrate abundance (or "density"; average number of organisms per m^2), Simpson's Evenness Index (E) and the Bray-Curtis Index of Dissimilarity as required under the MMER (Environment Canada 2012). Taxon richness included all separate 19 taxa identified to the lowest practical level, excluding any life stages that could not be conclusively identified as separate taxa. In some instances, for the purposes of data analysis, invertebrate taxa were combined at a generic taxonomic level in order to incorporate abundance associated with indeterminate taxa. This was only done when there were few species in the genus and indeterminates made up a significant proportion of generic abundance.

Simpson's indices of diversity ("D") and evenness ("E"), and the Bray-Curtis (B-C) index were computed from custom MS Excel macros and spreadsheets following the formulae presented by Environment Canada (2012). The B-C metric takes into account the abundance of each taxon at each station compared to the median abundance computed from the reference station data to compute an index of the relative "distance" of each station from a hypothetical reference median station. Larger B-C index values indicate greater dissimilarity from reference.

The relative proportions of the most abundant taxa were also computed (calculated as the abundance of each respective dominant/indicator taxon relative of the total number of organisms in the sample). Dominant/indicator taxon groups were defined as those groups representing greater than 25% of total organism abundance in at least one replicate sample or any groups considered to be important indicators of environmental stress. In the Phase 1 EEM, chironomids, bivalves, EPT taxa (Ephemeroptera, Plecoptera, and Trichoptera taxa), and oligochaetes were examined.

[2] Summary metrics were also calculated based on organisms sorted to lowest practical level [LPL] results can be found in Appendix D.

Community structure was also assessed using a multivariate technique known as correspondence analysis (CA). CA is used to calculate synthetic axes, which can be thought of as new variables summarizing variation in the relative abundance of benthic taxa. When depicted in two-dimensional plots, taxa that tend to co-occur will have similar CA axis scores and will plot together, while those that rarely co-occur plot farther apart. Similarly, stations sharing many taxa plot closest to one another, while those with little in common plot farther apart. The greatest variation among either taxa or stations is explained by the first axis, with other axes accounting for progressively less variation. Therefore, this type of multivariate analysis describes not only which stations have distinct benthic invertebrate communities but also how these communities differ among stations (i.e., which particular taxa differ). Prior to CA, the data were screened for rare taxa, and taxa occurring at 10% or fewer of the stations were removed as these can distort results. After screening and data reduction, abundances were log (x+1) transformed. Scores for both stations and for taxa were calculated using the ADE-4 package (Thioulouse et al. 1997).

All required and supplementary endpoints were summarized by separately reporting mean, median, minimum, maximum, standard deviation, standard error, and sample size for each sampling area (Environment Canada 2012). These endpoints were also plotted to explore spatial patterns and differences between effluent-exposed and reference areas to assist in data interpretation. Statistical comparisons between effluent-exposed and reference areas were conducted for each endpoint using Studentized T-tests. Data were assessed for normality and transformed as required to stabilize variances and satisfy assumptions of the T-Tests. Non-parametric techniques were used in instances in which transformation was unsuccessful in normalizing data or homogenizing variances. Statistical tests and plots were generated using SPSS Version 12 (SPSS Inc., Chicago, IL). Interpretation of benthic community metrics was enhanced by inspection of raw data and taxonomic proportions to detect patterns of ecologically relevant differences between effluent-exposed and reference areas. Benthic metrics calculated as explained above were then plotted to explore spatial patterns in the benthic community data with respect to the location of stations. Ecological and habitat requirements of taxa were assessed using standard references (Clarke 1981, Edmunds et al. 1976, Merritt and Cummins 1984, Merritt et al. 2008, Weiderholm 1983, Wiggins 1996).

The Technical Guidance Document (Environment Canada 2012) states that the benthic invertebrate community survey should minimally have sufficient power to detect a difference (effect size) of ± two standard deviations (SDs). Therefore, the magnitude of the difference between area means in each planned comparison was calculated for each benthic metric where a significant difference was detected. The magnitude of the difference was expressed as the number of reference mean SDs as follows:

magnitude of difference = (exposure mean – reference mean) / SD of the reference mean

If a significant difference between areas was not detected for a benthic metric, then the minimum effect size that could have been detected (had a large enough effect existed) was calculated using the mean square error generated from the ANOVA as an estimate of variability, with alpha and beta equal to 0.10. The minimum detectable effect size was based on the minimum number of reference area SDs, according to the following equation:

$$\delta = [(t_\alpha + t_\beta)(\sqrt{MSE})(\sqrt{2/n})]/SDref$$

where, δ = minimum detectable effect size,

MSE = mean square error,
n = sample size per area (in this case = 5), and
SDref = standard deviation of the reference area mean.

Possible relationships among the significant benthic invertebrate community indices and the supporting physical and chemical data observed were then examined using correlation analysis. A Bonferroni-type correction was applied to minimize the risk of declaring false positive correlations since at least 5% of derived correlations would be expected to occur by chance alone. Any significant correlations found at the adjusted p-value and/or at a p-level <0.05 were further investigated using scatter plots to determine if a continuous distribution of data was realized (possible causal relationships) or if these relationships were “leveraged” by outlying points (or groups of points).

2.6 Fish Survey

In accordance with the approved study design, a traditional lethal EEM fish population survey was undertaken in the effluent-exposed area of Pinewood River (PinR-EXP) and one reference area: Sturgeon Creek (StuC-REF; Figure 2.1). Following initial fish catches and consultation with Environment Canada during the field survey, it was determined that the sentinel species targeted would be brook stickleback and central mudminnow.

2.6.1 Sample Collection

Brook stickleback and central mudminnow were targeted from the effluent-exposed area on the Pinewood River and the Sturgeon Creek reference using backpack electrofishing, fine-mesh seine nets and minnow traps. All fishing was conducted under a License to Collect Fish for Scientific Purposes obtained from the Ontario Ministry of Natural Resources and Forestry (1086615; Appendix E). Supporting information recorded for each seine haul, backpack electrofishing pass, and minnow trap set included deployment and retrieval time (minnow traps),

seine haul distance, electrofishing seconds, water depth, GPS coordinates and habitat description. Upon net retrieval, all fish were identified, counted, and recorded on the appropriate field sheets. Twenty adult male and 20 adult female brook stickleback and central mudminnow were targeted in each area for the survey. All captured fish not utilized in the fish health assessment were identified, enumerated, and released.

2.6.2 Sample Processing

Sentinel species collected were held in aerated buckets and processed in an offsite laboratory. Sampled fish were individually sacrificed in a strong clove oil solution immediately prior to dissection. Lengths were measured using electronic calipers (to the nearest 0.01 mm) and weight was measured with a Scout Pro Balance (Model PSE-123) to the nearest 0.001 g with ± 1% precision. Both measures were recorded on data sheets. The presence of any external lesions, tumours, parasites or other abnormalities was also noted. Fish were opened using dissecting scissors and any internal abnormalities were noted. Processing involved removal of gonads and livers using dissecting tweezers and scissors, and measurement of gonad and liver weight to the nearest 0.001 g using an electronic balance surrounded by a draft shield. Whole female gonads were then preserved in 10% buffered formalin in containers labelled with the fish identification. Following processing, fish heads were frozen separately in labelled whirl-pak™ bags, for later extraction of otoliths for ageing (see Section 2.6.3 below).

Ovary samples were subsequently shipped to Zaranko Environmental Assessment Services (ZEAS) Laboratory in Nobleton, Ontario, for determination of fecundity and egg weight. All samples retained for ageing were shipped (frozen) to AAE Tech Services (Winnipeg, Manitoba), where otoliths were extracted for age determination using the crack and burn methodology.

2.6.3 Laboratory Analysis

2.6.3.1 Fecundity and Egg Weight

At ZEAS Laboratory in Nobleton, Ontario, whole ovary samples were drained into an 18-µm sieve to remove the preservative and then weighed to the nearest 0.001 g to determine the preserved gonad sample weight. Three sub-samples, each consisting of at least 100 eggs, were then removed and weighed. The weights of each subsample were recorded and the numbers of eggs in each sub-sample were counted under a microscope. The remainder of each sample was re-preserved and archived. Ten percent of egg samples were recounted to verify the precision of fecundity estimates. The number of eggs in the whole gonad was calculated as follows (for each sample):

$$gonad\ \ fecundity = \frac{total\ \ weight\ of\ \ preserved\ \ gonad\ sample}{weight\ of\ \ preserved\ \ sample}\ x\ number\ of\ \ eggs\ in\ \ preserved\ \ sample$$

The final fecundity estimate for each female was calculated as an average of the fecundity estimates from the three sub-samples.

Individual egg weights for each female were calculated as follows:

$$individual\ egg\ weight = \frac{weight\ of\ unpreserved\ gonad}{total\ fecundity}$$

2.6.3.2 Aging

AAE Tech Services Inc. estimated fish age by analyses of otoliths. Preparation of the otoliths for ageing was done using a Crack and Burn methodology. Briefly, the otoliths were mounted in epoxy resin and, after the epoxy hardened, sliced into micro-sections using a low-speed isomet diamond saw. Micro-sections were mounted onto glass slides using a mounting medium and read under a compound microscope using transmitted light. For each otolith, the age and edge condition was recorded along with the confidence rating for the age determination.

2.6.4 Data Analysis

Raw fish survey data collected in the field were transcribed from field sheets into electronic spreadsheets. The data were then checked by a separate individual for entry errors as part of the routine QA/QC procedures. Methods of data analysis recommended for EEM (Environment Canada 2012) were employed in the fish survey. Tabulated catch data were used to calculate catch-per-unit-effort (CPUE) for each area and fish collection method. Fish population data were summarized by separately calculating the mean, standard deviation, standard error, minimum, maximum and sample size of each measured variable by area, species, and gender.

Eight endpoints were used to evaluate the health of central mudminnow populations from the effluent-exposed (Pinewood River) and the reference area (Sturgeon Creek). Age was used as an indicator of survival. Weight-at-age, length-at-age, relative gonad weight, relative egg weight, and relative fecundity were used as indicators of energy use. Condition and relative liver weight were used as indicators of energy storage. The same endpoints (with the exception of the endpoints containing age) were used to evaluate the health of brook stickleback populations from the effluent-exposed and the reference area. All health endpoints were analyzed separately for males and females. Prior to statistical analyses, the raw body weight for each fish was adjusted to account for the gonad and liver weights of each fish (i.e., adjusted body weight = raw body weight – gonad weight – liver weight). Of the endpoints assessed, EEM effect endpoints for a lethal fish survey include weight-at-age, relative gonad weight, condition, and relative liver weight, while the remaining comparisons are considered supporting endpoints (Environment Canada 2012).

Statistical comparisons of age between areas were conducted using the two-sample t-test when residuals for the assumption of normality or homogeneity of variances were met (Shapiro-Wilks' test and Levene's test, respectively ($\alpha = 0.05$). When the assumption of equal variances was not met but the assumption of normality was met, the t-test for unequal variances was used (Ruxton 2006). Data were $\log_{10}$-transformed as necessary to meet the assumptions. When the assumptions of normality could not be met, then the Mann-Whitney test was used. Area comparisons were assessed using a significance level ($\alpha = 0.1$).

Statistical comparisons of weight-at-age and length-at-age between areas were conducted using analysis of covariance (ANCOVA) with $\log_{10}$-transformed body size as the response, area as a factor, and $\log_{10}$-transformed age as a covariate. Few fish were aged greater than 2 years old for central mudminnow so the analysis was conducted using age 1 and 2 fish only so the ANCOVA was equivalent to a two-way analysis of variance (ANOVA) with age as the second factor.

Statistical comparisons of relative liver weight, relative gonad weight, relative egg weight, and relative fecundity between areas were conducted using ANCOVA with $\log_{10}$-transformed response variables and adjusted body weight ($\log_{10}$-transformed) as a covariate. Condition was analyzed using ANCOVA with $\log_{10}$-transformed adjusted body weight ($\log_{10}$-transformed) as the response and fork length ($\log_{10}$-transformed) as a covariate.

Significant interactions between the area and the covariate (i.e. the assumption of homogeneity of regression slopes between areas) in the ANCOVA were assessed using $\alpha = 0.05$. When the interaction term was significant, the coefficients of determination (R^2) of the interaction model and parallel slope model were compared to assess whether the slopes were practically significant. If the R^2 was > 0.8 and within 0.002 between the two models, the conclusion was that the interaction model and parallel slope models were practically the same (Environment Canada 2012) and the ANCOVA proceeded with the parallel slope model. Influence was also assessed using Cook's distance statistic when a significant interaction was detected. If the interaction was driven by influential points, these were removed from the analysis (Environment Canada 2012). When the interaction could not be removed by comparison of R^2 values or removal of influential points, the conclusion was that the difference in the response variable between areas was dependent on the covariate values. When the interaction term was not significant, the interaction term was removed from the model and the parallel slope ANCOVA model was fit. When the covariate was not a significant predictor of the response variable in the parallel slope ANCOVA model, the analysis proceeded as a t-test or Mann-Whitney test (as described for age). Area comparisons in the ANCOVA analyses were assessed using a significance level ($\alpha = 0.1$).

The data were plotted using individual value plots for univariate endpoints and scatterplots for bivariate endpoints prior to analysis. Statistical outliers were defined to be observations with

Studentized residuals with magnitude > 4 (Environment Canada 2012). Statistical analyses were reported for comparisons with and without the outliers to assess the influence of the outlier on statistical significance and the magnitude of difference. All statistical analyses were conducted using Minitab 18 software (Minitab 2017).

A magnitude of difference between the effluent-exposed area and reference area was calculated for each endpoint as a percentage of the reference area as:

$$\text{Magnitude of Difference} = (\text{Exp} - \text{Ref})/\text{Ref} \times 100\%$$

using either medians (Mann-Whitney), means (t-test), or the covariate-adjusted means (ANCOVA, without interaction). When an interaction was observed, the magnitude of difference was estimated for small and large fish at the minimum and maximum values of the overlap in covariate values between areas using the predicted values of the response variables from the interaction ANCOVA regression model (Environmental Canada 2012). When response variables are $\log_{10}$-transformed, the means are reported in the original data units (i.e. anti-logged), equivalent to geometric means.

An estimated minimum detectable difference (MDD) using $\alpha=\beta=0.1$ was calculated for each endpoint using either the coefficient of variation (pooled standard deviation divided by reference mean) for untransformed data or the pooled standard deviation of regression residuals for $\log_{10}$-transformed data, and reported as a percentage difference relative to the reference mean. The MDD percentage was reported as both a percentage increase, and a percentage decrease because MDD differs with respect to the direction of $\log_{10}$-transformed measures. The MDD calculations for the M-W test were estimated based on a two-sample t-test using sample sizes multiplied by 0.864 and rounded up to the nearest integer. The 0.864 is the lower bound of the asymptotic relative efficiency of the Mann-Whitney test and the two-sample t-test (Hodges and Lehmann 1956). The MDD calculations were conducted using the two-sample t-test power analysis function in Minitab 18 software (Minitab 2017).

An *a priori* power analysis was conducted for each endpoint using the observed variability from the 2017 data analyses to estimate the sample sizes required to detect a range of effect sizes. The analyses were conducted using the two-sample t-test power analysis function in Minitab 18 software (Minitab 2017) using the same estimates of variability and assumptions for the M-W test as described for the MDD calculations.

3 EFFLUENT SUBLETHAL TOXICITY

3.1 Toxicity Test Results

Sublethal toxicity tests conducted on grab samples of RRP final effluent at Final Discharge Point 2 (FDP2) and Final Discharge Point 3 (FDP3) over the Phase 1 EEM period (2016 to 2017) indicated that effluent was generally of high quality with the lowest reported effects occurring at effluent concentrations of 37% and 95% for FDP2 and FDP3 respectively.

FDP2 sublethal toxicity tests did not elicit effects on fathead minnow survival or on growth of the green algae *Pseudokerchneriella subcapitata* (*P. subcapitata*) at any point during the Phase 1 EEM (Table 3.1). However, FDP2 effluent impaired the survival and growth of the invertebrate *Ceriodaphnia dubia* in 2016 (92% and 72% effluent, respectively; Table 3.1), but not in 2017. This same pattern was observed for the growth of fathead minnow and duckweed (*Lemna minor*) frond size (i.e. weight) with impairment occurring in 2016 (37% and 76%, respectively, Table 3.1) but not 2017. Conversely, frond production for *L. minor* was consistently impaired by FDP2 effluent in both years of the Phase 1 EEM (55% and 64%, respectively; Table 3.1).

FDP3 effluent was of excellent quality with virtually no impairment for any of the test organisms (Table 3.1). It is noteworthy that *P. subcapitata*, usually being the most sensitive species, was not affected by exposure to effluent from either FDP (Table 3.1).

3.2 Predicted Receiving Environment Influence

When sublethal effects are reported at effluent concentrations lower than 30% it is recommended that mines calculate the implied geographic extent of the effect (Environment Canada 2012). Since the geometric mean effect concentrations for effluent sublethal toxicity tests were above 30% in the Phase 1 EEM period, this was not required.

Generally, adverse effects on resident aquatic biota would not be predicted in the Pinewood River based on the lowest effluent concentration effect occurring at 37% (fathead minnow growth), since effluent concentrations in the receiving environment have been estimated to be ≤14% (Minnow 2016).

Table 3.1: Sublethal Toxicity Test Results for RRP Effluent (as % effluent)

[a] Effluent concentration causing 50% mortality among exposed organisms.

[b] Effluent concentration at which a 25% inhibition/reduction in endpoint was observed among effluent-exposed organisms relative to control group.

[c] Range could not be calculated.

[d] A statistically reasonable estimate could not be calculated. However, according to Equal Variance t two-sample Test (CETIS), there was no significant reduction in growth between the control and the 100% test concentration.

[e] A statistically reasonable estimate could not be calculated. However, according to Fisher Exact Test (CETIS), mortality in the 100% effluent concentration (0%) was not significantly higher than in control (10%).

4 RECEIVING WATER QUALITY

4.1 Water Quality during the EEM

Physico-chemical measurements taken in April showed that water quality was generally similar in the effluent-exposed and reference sampling areas with the exception of higher specific conductivity and pH in the effluent-exposed area (Table 4.1; Appendix Table C.1).

Table 4.1: In Situ Surface Water Quality Data Collected during the Fish Survey for RRP Phase 1 EEM, 2017

Area Idenifier	Date	Temperature (°C)	pH	Dissolved Oxygen		Specific Conductivity (µS/cm)
				(mg/L)	(% sat)	
StuC-REF	24-Apr-17	5.9	6.90	11.86	94.3	153
PinR-EXP	24-Apr-17	5.6	7.46	11.86	93.6	303

In situ water quality measurements were also taken in September at all benthic community survey stations and indicated significant differences in temperature and specific conductance between areas (Figure 4.1; Appendix Tables C.1, and C.2). Differences observed in temperature likely reflect the time of day the measurements were taken (e.g., early morning versus mid-afternoon). Whereas the difference in specific conductance was likely due to mine effluent (Figure 4.1; Appendix Tables C.1, and C.2).

Laboratory analysis of water samples indicated that chromium and iron were slightly elevated in the reference area compared to effluent-exposed area and Provincial Water Quality Objectives (PWQO; Table 4.2). Hardness, calcium, potassium, and sodium, were elevated in the effluent-exposed area relative to reference area concentrations (Table 4.2) and likely contributed to observed elevations in specific conductance in the effluent-exposed area (Figure 4.1). Lastly, aluminum was elevated compared to PWQO both in the effluent-exposed and reference areas indicative of naturally elevated background concentrations of this substance (Table 4.2).

4.2 Routine Water Quality Monitoring

RRP collects water samples and supporting measures a minimum of four times per year at locations upstream (SW20) and downstream (SW22A) of the mine effluent discharge in the Pinewood River (Figure 2.1).

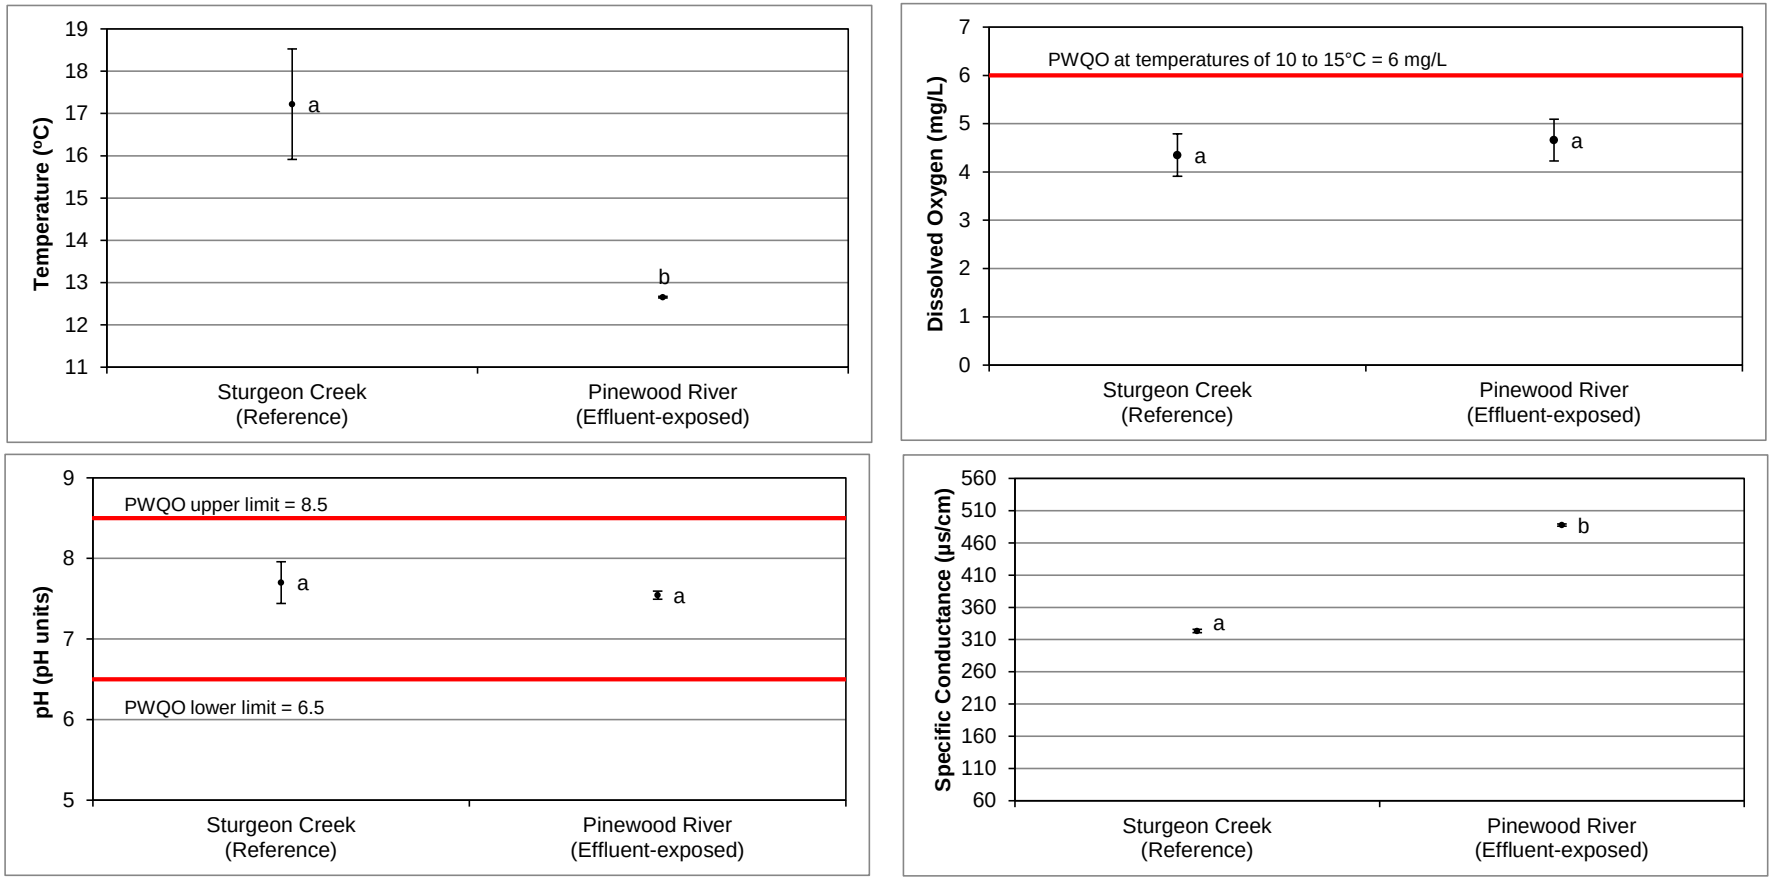

Figure 4.1: ***In Situ*** **Water Quality Measures at Benthic Sampling Stations, RRP Phase 1 EEM, September 2017**

Notes: Area mean ± standard deviation (n=5) are shown. Same letters above error bars indicate no significant difference.

[a] Guideline for free cyanide. Applied to weak acid dissociable and total cyanide as a conservative limit.

Indicates concentration was greater than the PWQO (Provincial Water Quality Objective) Lowest Effect Level (LEL).

Mean concentrations of aluminum and iron were elevated above PWQOs for the protection of aquatic life at routine water quality monitoring stations located both upstream and downstream of the RRP effluent outfall (Table 4.3). Downstream concentrations of nitrite were elevated relative to both upstream levels and PWQOs, indicative of mine influence (Table 4.3; Appendix Table C.4). However, nitrite was only elevated substance relative to PWQO downstream of the RRP Mine effluent in 2016 and is likely indicative of use of explosives from active blasting during the construction phase of the mine (Table 4.3). As seen in the water samples collected during the EEM study, aluminum and iron are elevated at relative to PWQO at effluent-exposed and reference areas, indicating these substances are naturally elevated within the Pinewood River.

Overall, the RRP Mine effluent is detectable in Pinewood River, through elevated conductivity, hardness, calcium, potassium, and sodium in the effluent-exposed area relative to upstream.

Concentration exceeds PWQO.

[a] Mean of monthly samples collected during discharge (n=8 in 2015, n=10 in 2016, and n=11 in 2017).

[b] All guidelines reference Provincial Water Quality Objectives. Ministry of Environment and Energy, July 1994, re-issued in 1999 (OMOEE 1994), with the exception of nitrite and selenium which reference Canadian Water Quality Guidelines for the protection of aquatic life. Canadian Council of Ministers of the Environment. http://st-ts.ccme.ca/. accessed February 2018 (CCME 2018).

[c] Aluminum guideline depends on pH; cadmium, copper and lead guidelines depend on hardness; guidelines in table assume: pH = 7, temperature = 15°C, hardness = 130 mg/L as $CaCO_3$ based on the average background concentration at reference station SW20 (see Appendix Table C.4).

[d] All values but one (March 23, 2016; 5.66 mg/L) are < PWQO, with 3 below the lowest reported level.

5 SEDIMENT QUALITY

5.1 Overview

Sediment samples were collected in the effluent-exposed area of the Pinewood River and the Sturgeon Creek reference area concurrent with benthic invertebrate sampling (Figure 2.1). A total of five stations were sampled within each area as described in Section 2.

5.2 Sediment Composition

The inorganic sediment fraction was composed predominantly of silt (37-69%) and clay (25-41%), with some sand (2-31%; Figure 5.1, and Table 5.1; Appendix Table C.5). There were significant differences between the effluent-exposed and reference areas for total organic carbon, as well as the silt and clay fractions, with significantly more TOC and silt in the effluent-exposed area, and significantly less clay when compared to the reference area (Table 5.1 and Figure 5.1; Appendix Table C.3). All stations had a low proportion of gravel <5% (Table 5.1; Appendix Table C.5).

Indicates concentration greater than the PSQG (Provincial Sediment Quality Guideline) Lowest Effect Level (LEL).
Indicates concentration greater than the PSQG (Provincial Sediment Quality Guideline) Severe Effect Level (SEL).

5.3 Sediment Quality

Sediment concentrations of chromium, and nickel were elevated in both the effluent-exposed and reference areas, compared to Provincial Sediment Quality Guideline (PSWQG) Lowest Effect Levels (LEL; Table 5.1; Appendix Table C.5). Additionally, effluent-exposed sediment concentrations of manganese and phosphorus were elevated compared to reference area concentrations and the PSQG LEL (Table 5.1 and Appendix Table C.5). Total organic carbon (TOC) was above the PSQG LEL in both areas, there were no Severe Effects Level (SEL) exceedances except for total Kjeldahl nitrogen (TKN) at the effluent-exposed area, TKN was also greater than LEL at the reference area (Table 5.1).

Principal Components Analysis (PCA) identified arsenic, barium, beryllium, boron, copper, iron, molybdenum, nickel, titanium, vanadium, and zinc as the main analytes distinguishing the effluent-exposed sediment chemistry from that of the reference area along PC-Axis 1 (Appendix Tables C.5 and C.6). Sediment PC-Axis 2 scores were compared between the effluent-exposed and reference areas and largely described the higher sediment concentrations of antimony, calcium, magnesium, phosphorus, selenium, sodium, strontium, and sulphur in the effluent-exposed area, and higher zirconium concentrations in the in the reference area (Appendix Tables C.5 and C.6).

Overall, sediment chemistry was very similar between the effluent-exposed and reference areas, with slightly elevated concentrations of TOC, TKN, manganese, and phosphorus in the effluent-exposed sediments relative to both reference and provincial sediment quality guidelines.

6 BENTHIC INVERTEBRATE COMMUNITY

6.1 Overview

The benthic invertebrate community of the effluent-exposed area on Pinewood River (PinR-EXP) was compared to that of one reference area: on the Sturgeon Creek (StuC-REF; Figure 2.1).

6.2 Primary Metrics

Organism density, taxon richness, and Simpson's evenness (E) did not differ between areas (Table 6.1 and Figure 6.1). Bray-Curtis (B-C) index (distance) at the effluent-exposed area was significantly greater that at the reference area (Table 6.1; Figure 6.1), suggesting community composition differences that are investigated further in the following section.

Table 6.1: Summary of Benthic Invertebrate Community Characteristics and Statistical Comparisons Between Areas, RRP Phase 1 EEM, 2017

Type	Benthic Community Metric	Significantly Different? (effect size expressed as # reference area standard deviations) [a]
		StuC Reference vs PinR Effluent-exposed
Metrics for evaluating effect under MMER (Family Level)	Density (Ind./m^2)	No

	CA Axis-2 (25.6%)	No
	CA Axis-3 (17.9%)	No

[a] Where a statistically significant difference was found, the value represents the number of standard deviations and direction of change (positive or negative) by which the exposure area differed from reference.

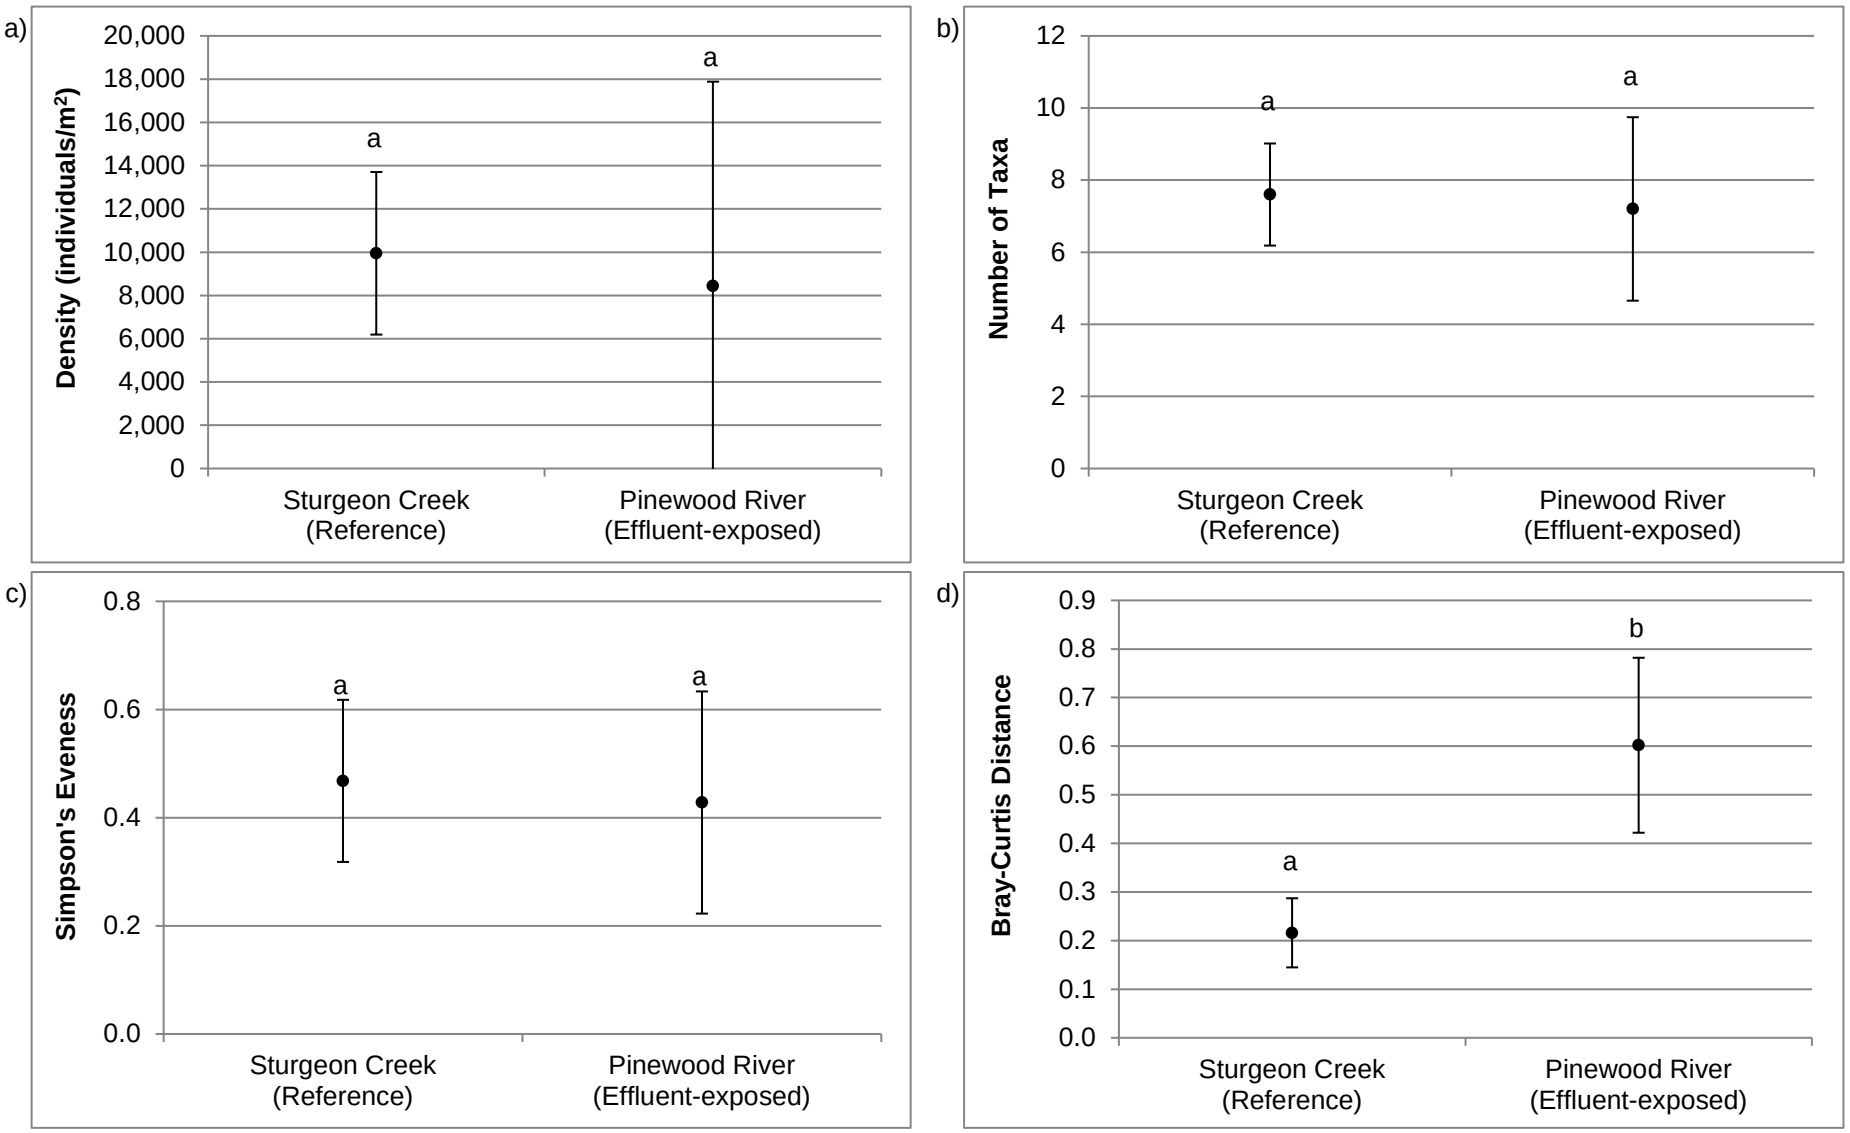

Figure 6.1: Comparison of: a) Benthic Invertebrate Density, b) Number of Taxa, c) Simpson's Evenness and d) Bray-Curtis Distance to Reference Median, RRP Phase 1 EEM, 2017

Data Represent Area Means and 95% Confidence Intervals (n=5 in all areas). Areas with the Same Letter do not Differ Significantly (p>0.1).

6.3 Taxon Group Composition

Benthic community composition was assessed based on percent representation of major taxon groups to highlight any differences between exposed and reference areas and their environmental significance. Chironomids and Oligochaeta showed comparable percent abundances between areas (Figure 6.2 and Table 6.1; Appendix Tables D.3 to D.5). The pollution-intolerant EPT (Ephemeroptera, Plecoptera[3], and Trichoptera) taxa were found in very low abundances in both the reference and effluent-exposed areas which is likely a result of the nature of the habitat found in these areas (i.e. low flow depositional areas; Table 6.1; Appendix Table D.4). Overall, community composition of the effluent-exposed area was similar to reference with no compelling evidence of an effluent-related effect.

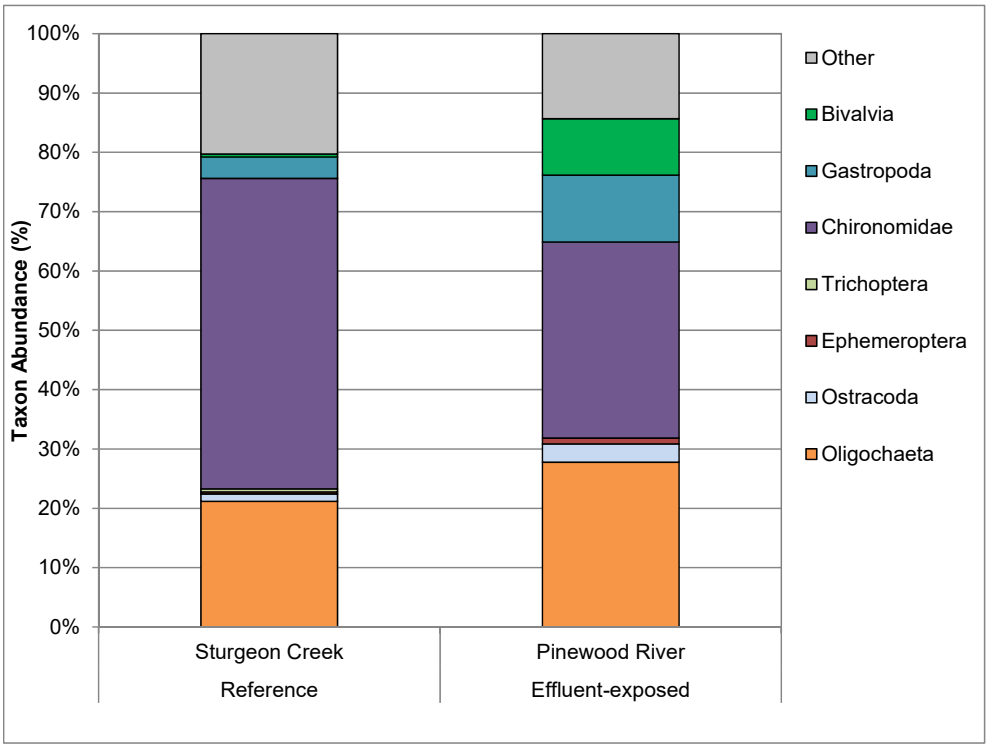

Figure 6.2: Percent Composition of Dominant Benthic Groups, RRP Phase 1 EEM, 2017

Correspondence Analysis (CA) was also used to examine community composition. Unlike the B-C distance metric and Simpson's Indices, this multivariate technique can identify the individual taxa that most contribute to community variation. In the present study, CA explained 52.1% of the total community variance in the first two CA axes and differed between areas (Figure 6.3 and

[3] Plecoptera (stoneflies), were not found at either area.

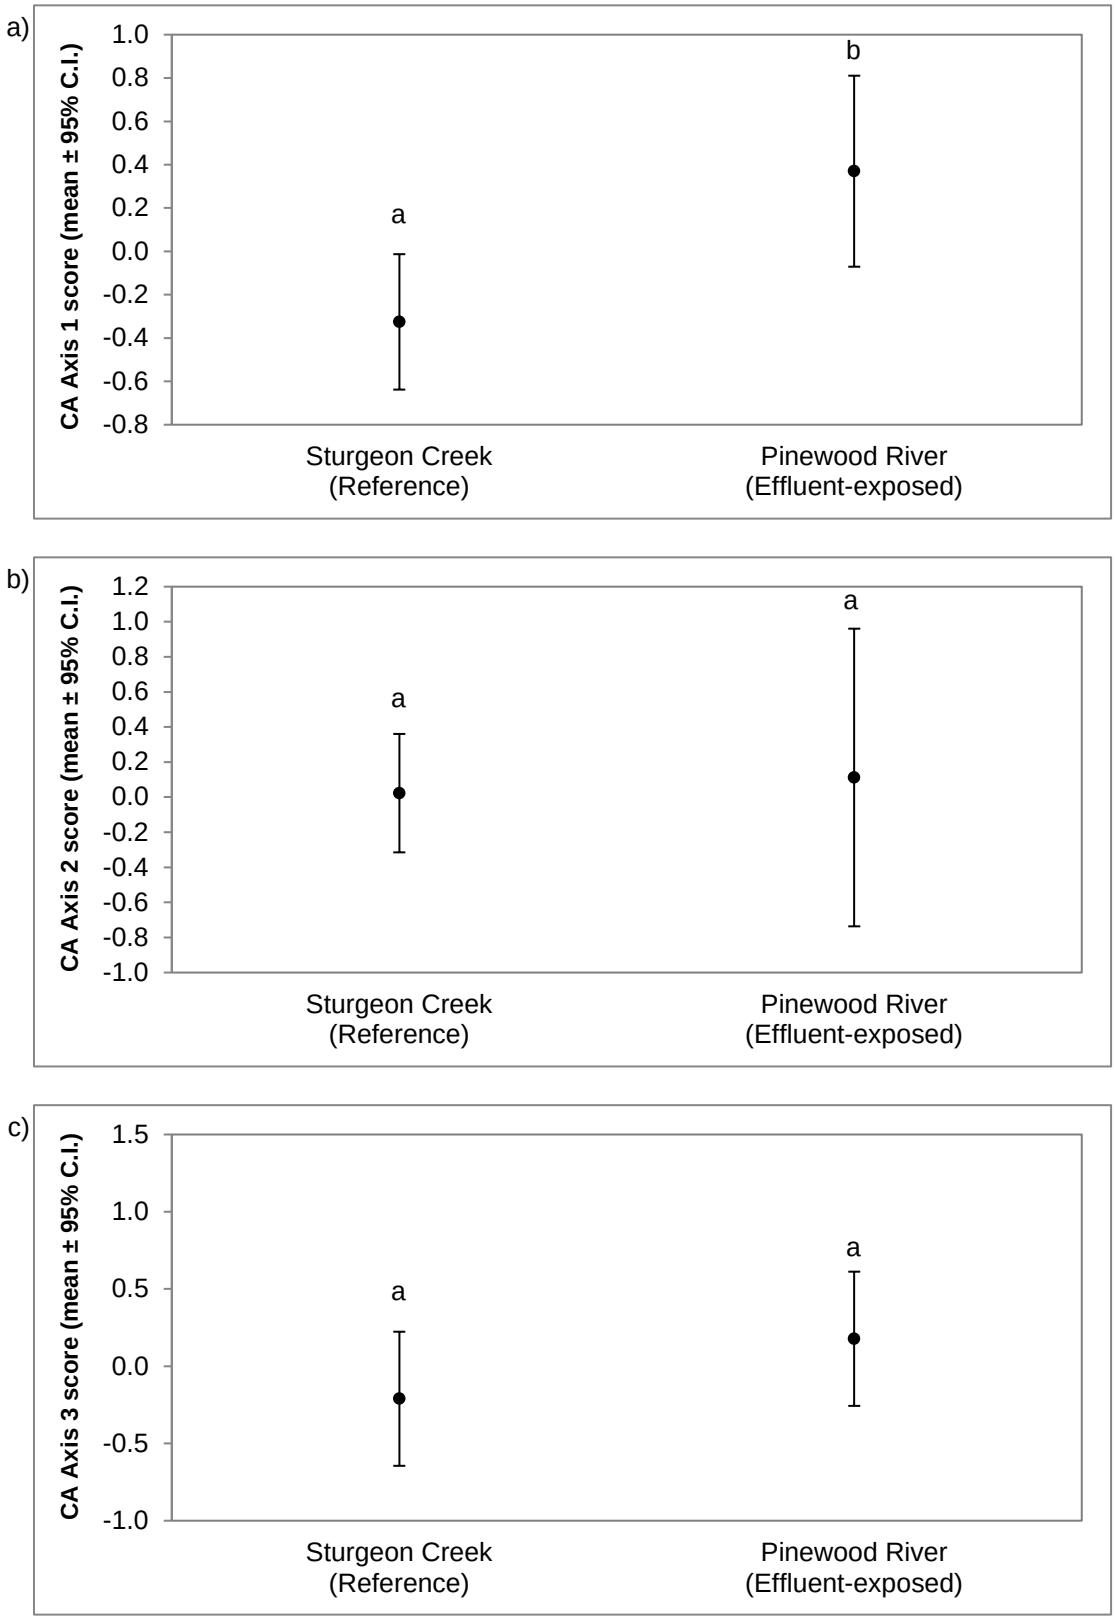

Figure 6.3: Results of Correspondence Analysis of Benthic Invertebrate Communities, RRP Phase 1 EEM, 2017

Note: Areas with the same letter do not differ significantly.

Table 6.1; Appendix Tables D.6 and D.7). CA axis-2 and -3 showed no difference between areas, (Figure 6.3 and Table 6.1). This was largely due to the presence of harpacticoids[4] in the reference area, but absence from the effluent-exposed area, as well as the presence of the snail family Hydrobiidae and bivalve Sphaeriidae at the effluent-exposed area, and absence from the reference area (Figure 6.4 and Appendix Table D.7).

In general, the Sturgeon Creek reference area demonstrated less within area variability relative to the Pinewood River effluent-exposed area (Figure 6.4). The effluent-exposed area and Sturgeon Creek reference area had a statistically different community structure as defined by CA axis-1.

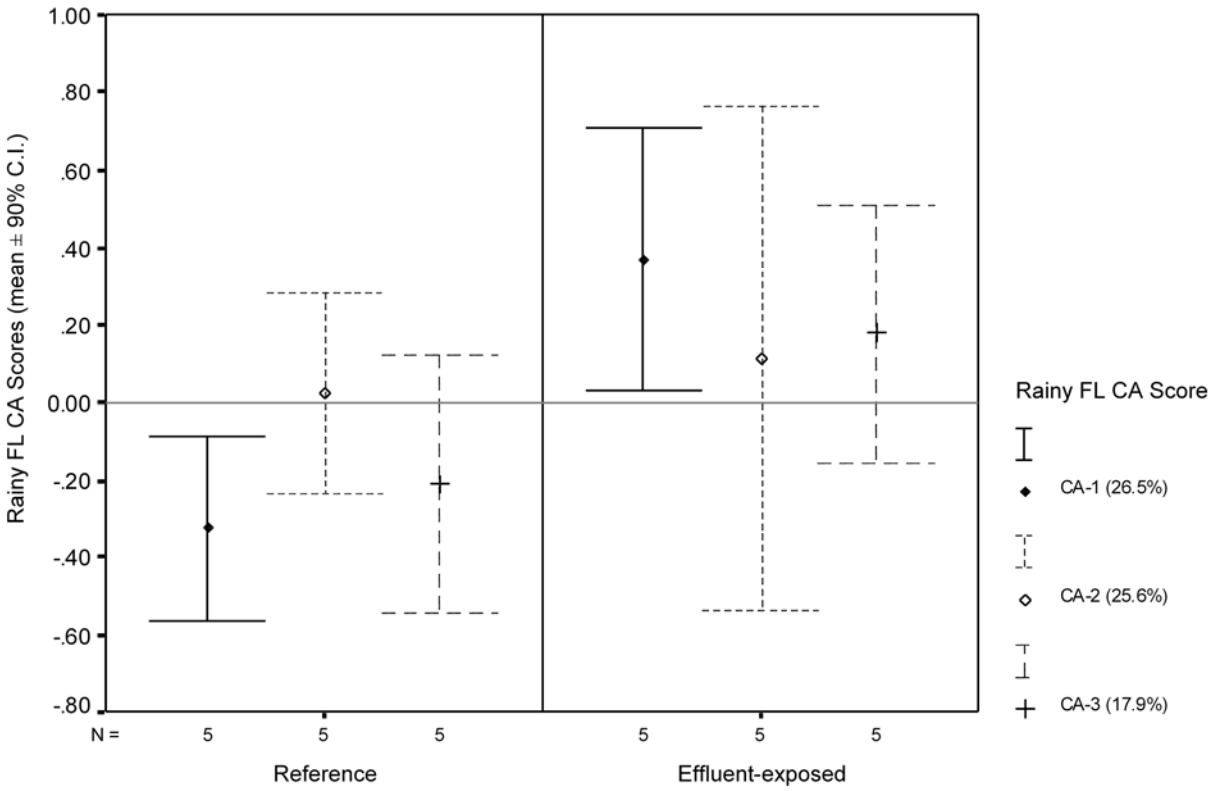

Figure 6.4: Family Level (FL) Correspondence Analysis (CA) Scores at RRP Phase 1 EEM, 2017

[4] Due to their small size harpacticoids can sometimes be lost in the screening process, and because they are commonly found attached to algae or other organic material organism retention can vary with substrate type. Substrate type and volumes of organic material in samples did not vary between exposure and reference areas and therefore it is unlikely that any variation in harpacticoid abundances between areas is the result of loss during screening.

6.4 Influence of Physico-Chemical Variables

Correlation analysis was performed between benthic indices and supporting physico-chemical variables that demonstrated statistically significant differences between areas. A statistically significant correlation between two variables may, but does not necessarily, indicate a cause-and-effect relationship. Three correlations were significant at an adjusted p-level that accounted for the number of comparisons made ($p = 0.05/70 = 0.00071$; Table 6.2). After inspection of data distributions in scatter plots (Appendix Figure D.1a, b, and c), the significant correlations appear to be due to spatial autocorrelation of replicates within areas and is likely not a function of effluent related effects.

6.5 Summary

In summary, the effluent-exposed area was similar to the reference area concerning three EEM metrics for the current EEM Phase, these are density, Simpson's evenness, and taxon richness. The sole EEM benthic endpoint that differed significantly between the effluent-exposed and reference areas is the Bray-Curtis Index. In addition, the community structure as defined by CA differed significantly between the effluent exposed and reference areas. This difference may be attributed to variations between the sampling areas such as stream width: the Sturgeon Creek reference area is much smaller compared to that of the effluent-exposed area, as well as extensive beaver activity in the vicinity of the effluent-exposed area, these habitat differences may result in certain families being present in one area but not in the other (i.e. Chaoboridae), as they are found in the reference area in relatively high abundances, but have very little representation in the effluent-exposed area (Appendix Table D.2).Therefore these differences are likely a result of dissimilarities in habitat between the effluent-exposed and reference areas, rather than a direct effluent effect.

7 FISH COMMUNITY SURVEY

7.1 Overview

Fish were sampled from the effluent-exposed area on the Pinewood River, as well as a reference area on Sturgeon Creek (Figure 2.1). Brook stickleback and central mudminnow were sampled from both the reference and effluent-exposed areas. Detailed data are provided in Appendix E.

7.2 Fish Community

Fish communities were evaluated in two areas: the effluent-exposed area of the Pinewood River, and the Sturgeon Creek reference area (Figure 2.1). A total of eleven species were caught in the two areas, with the greatest diversity found in the effluent-exposed area (Table 7.1; Appendix Tables E.1 to E.3).

Table 7.1: Summary of Fish Caught in the Sturgeon Creek Reference and the Effluent-exposed Areas, RRP Phase 1 EEM, 2017

Species	Sturgeon Creek (Reference)	Pinewood River (Effluent-exposed)
Total No. of Species	**7**	**11**
Sentinel Species		
Brook stickleback	224	1,757
Central mudminnow	100	81
Other		
Brown bullhead	-	1
Brassy minnow	6	91
Creek chub	11	-
Dace spp.	-	104
Finescale dace	2	3
Johnny darter	-	2
Lake chub	3	10
Pearl dace	-	4
Northern redbelly dace	48	27
White sucker	-	9
Total Fish Caught	**394**	**2,089**

Pinewood River supports a variety of fish species, ranging from the large-bodied species such as northern pike (*Esox lucius*), walleye (*sander vitreus*), and white sucker (*Catostomus*

commersonii), to a number of small-bodied species (Table 7.1). During the spring sampling, brook stickleback were the most abundant species found in both sampling areas (Table 7.1). Brown bullhead (*Ameiurus natalis*), johnny darter (*Etheostoma nigrum*), pearl dace (*Margariscus margarita*), and white sucker were only observed in the Pinewood River whereas creek chub (*Semotilus atromaculatus*) were only found in Sturgeon Creek. Overall, species composition was similar between areas, with the fish community predominantly being made up of brook stickleback, central mudminnow, and northern redbelly dace (*Chrosomus eos*).

Overall catch-per-unit-effort (CPUE) for seines (# fish/m^3), minnow traps (# fish/trap day) and backpack electrofishing (#fish/ minute) were highest in the Pinewood River effluent-exposed area (Table 7.2). Minnow trapping was the most effective method employed during the spring survey (Table 7.2).

Brook stickleback CPUE for minnow trapping was highest in the effluent-exposed and central mudminnow CPUE was highest at the reference area (Table 7.2).

Overall, no major differences in community composition were observed among areas although the effluent-exposed area of the Pinewood River supported the highest species diversity.

7.3 Brook Stickleback

Twenty three female brook stickleback from the Pinewood River (effluent-exposed) and 23 from Sturgeon Creek reference area were collected during the Phase 1 spring fish survey (Appendix Tables E.4 and E.5). In addition, 21 male brook stickleback from the Pinewood River (effluent-exposed), and 22 from the Sturgeon Creek reference area were collected (Appendix Tables E.6 and E.7). All collected brook stickleback were subject to measurements needed to calculate the required EEM metrics, which were summarized by sex and area (Appendix Tables E.4 to E.7).

7.3.1 Female Brook Stickleback

Female brook stickleback from the Pinewood River effluent-exposed and Sturgeon Creek reference areas were of similar age (Figure 7.1a and Table 7.3). Females captured in both areas were predominantly one year old (Figure 7.1a; Appendix Tables E.4 and E.5). Accordingly, there was insufficient age distribution for analysis of body weight at age (Appendix Tables E.4 and E.5).

Gonad size relative to adjusted body weight was significantly larger in female brook stickleback captured in the Pinewood River than in those from Sturgeon Creek, with the magnitude of difference greater than the applicable critical effect size (CES) of ±25% (Table 7.3 and Figure 7.2; Appendix Tables E.4 and E.5). Egg weight relative to adjusted body weight was significantly smaller in effluent-exposed females compared to reference females, however the magnitude of difference was very small (0.13%) and is not ecologically meaningful. These data indicated that

Table 7.2: Catch-per-unit-effort (CPUE) Summary for Sentinel Fish Caught during the RRP Phase 1 EEM, Arpil 2017

a) CPUE by Seine [a]

Location	Total Effort (Area m^2)	Brook Stickleback CPUE	Central Mudminnow CPUE	Total Sentinel Species	
				Catch	CPUE

Location P-value < 0.1 or Interaction P-value < 0.05

Magnitude of Difference > 25% (or > 10% for Condition), EEM effect endpoints only.

Covariate P-value > 0.05

Note: Three large fish had high leverage on the regressions so these observations were removed from the ANCOVAs

[a] The mean value of the covariate (that corresponds to the adjusted means for the response variable) for the parallel slope ANCOVA model or the minimum and maximum values of the overlap in covariate values for the interaction ANCOVA model.

[b] The median, mean, and adjusted mean are reported for Mann-Whitney, t-test and ANCOVA, respectively, and the predicted values of the regression line equations for minimum and maximum values of the covariate (where the data sets overlap) for ANCOVAs where a significant interaction (i.e., different slopes) occurs.

[c] The magnitude of difference calculated as: [(exposed area mean - reference area mean) /reference area mean] x 100. When there is a significant interaction in the ANCOVA, the magnitude of difference is calcaulated at the minimum and maximum values of overlap in covariate values as as: [(exposed area predicted value - reference area predicted value) / reference area predicted value] x 100.

[d] Four fish from Pinewood River had large egg weights and lower fecundity. The results of the analyses for egg weight and fecundity are shown for the datasets that include and exclude these four fish.

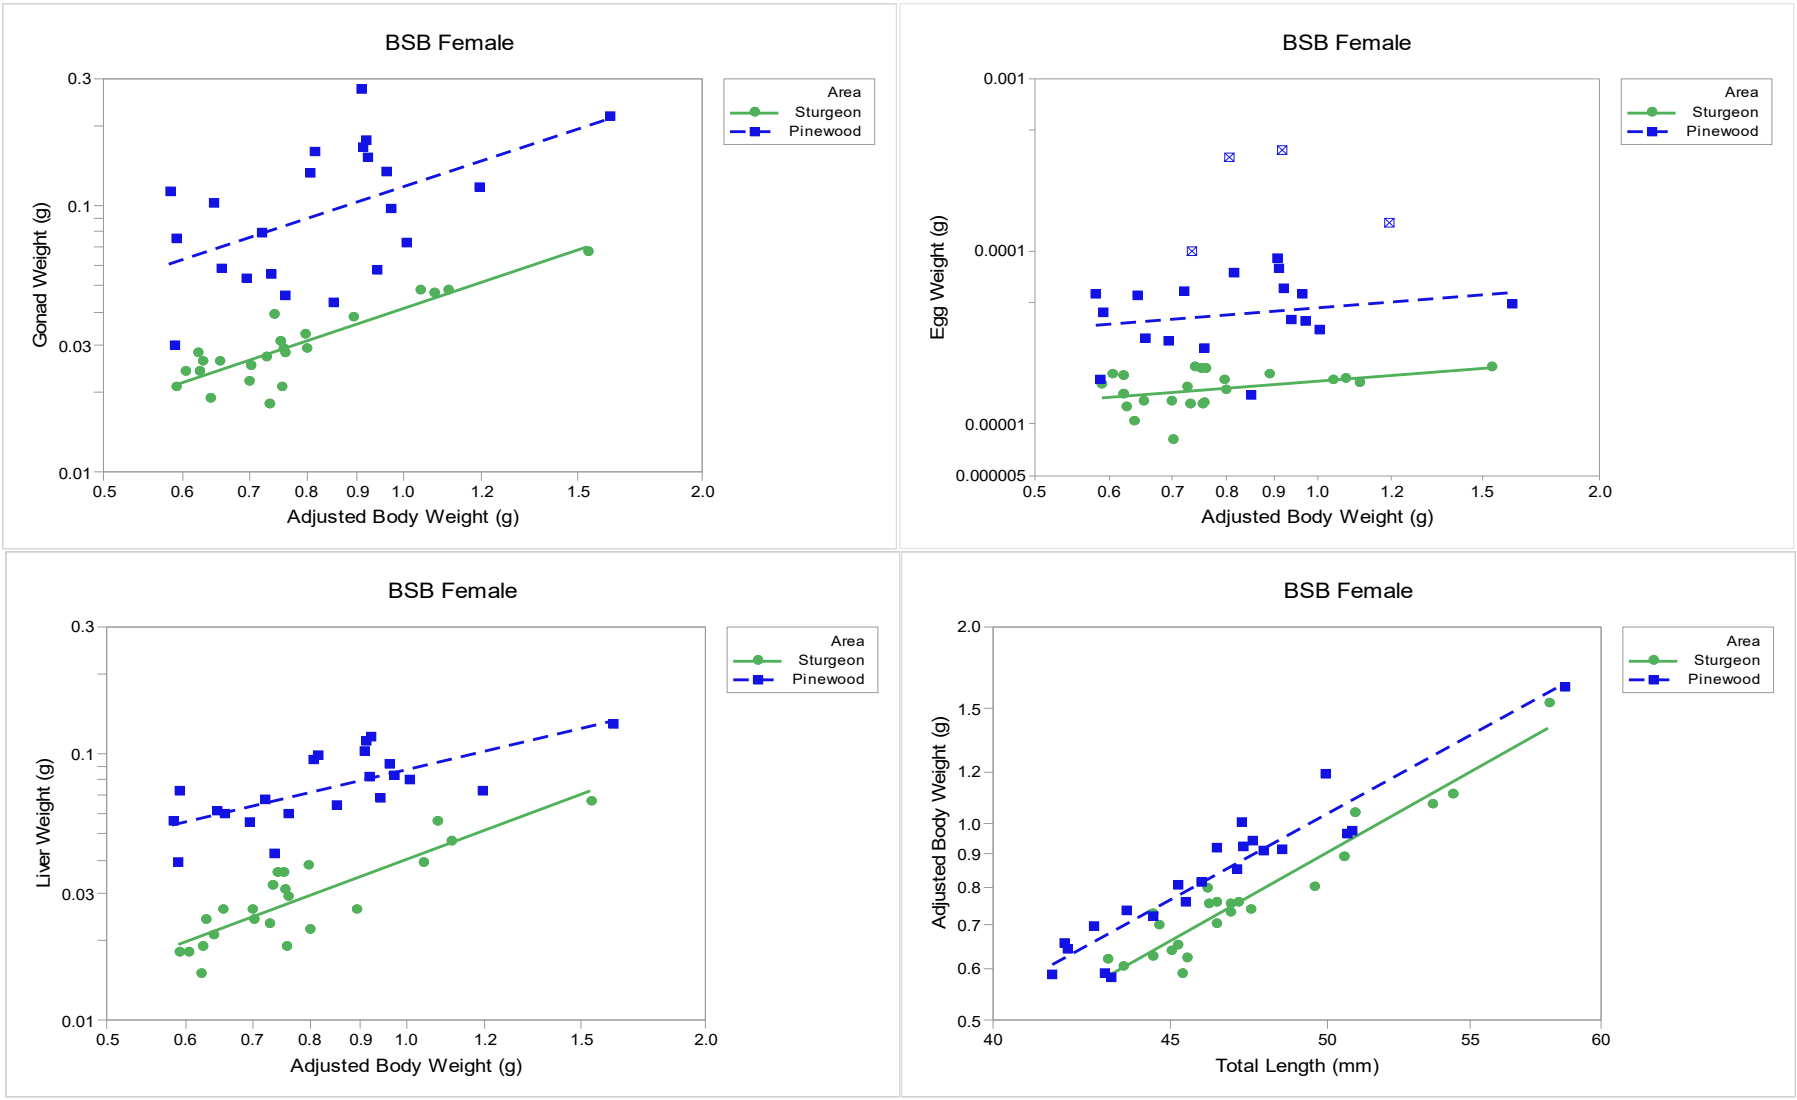

Figure 7.2: Scatterplot and Linear Regressions For Female Brook Stickleback Health Endpoints For Pinewood River (Effluent-exposed) Compared to Sturgeon Creek (Reference), RRP Phase 1 EEM, 2017

Notes: outliers are plotted as open symbols with an × through them

Pinewood River females had proportionately larger ovaries compared to those at Sturgeon Creek, suggesting greater energy allocation towards reproduction in the Pinewood River female brook stickleback population. Relative liver size and body condition of female brook stickleback from the Pinewood River were both significantly greater than those captured at Sturgeon Creek, with the magnitude of difference for both endpoints outside of the applicable CES (± 25% for liver weight and ±10% for condition; Table 7.3 and Figure 7.2). There were low incidences of abnormalities noted for both areas. These data indicate that Pinewood River females devote more resources to energy storage than those from the Sturgeon Creek, possibly indicative that food resources available to brook stickleback at Pinewood River differed from resources available at Sturgeon Creek.

Overall, female brook stickleback collected at Pinewood River effluent-exposed area showed no difference in age, but significantly larger relative gonad size, larger relative liver weight, and higher condition compared to those captured at Sturgeon Creek.

7.3.2 Male Brook Stickleback

Male brook stickleback from the Pinewood River effluent-exposed area did not differ in age relative to those from the Surgeon Creek reference (Figure 7.1b). Males captured in both areas were all one year old (Figure 7.1b; Appendix Tables E.6 and E.7).

Gonad weight relative to adjusted body weight was similar between effluent-exposed male brook stickleback and Sturgeon Creek reference males (Table 7.3; Appendix Tables E.6 and E.7). Relative liver size and body condition of male brook stickleback were both significantly greater than those captured at Sturgeon Creek, with the magnitude of difference for both endpoints outside the CES (Table 7.3 and Figure 7.3; Appendix Tables E.6 and E.7). Similar to the female brook stickleback, there was a very low occurrence of abnormalities noted.

Overall, male brook stickleback collected at Pinewood River showed no difference in age, but significantly larger livers and body condition compared to those captured at Sturgeon Creek. The survival (age) and energy storage responses of male brook stickleback were very similar to those of females between Pinewood River and Sturgeon Creek. These responses may have reflected differences of food resources/assemblages, and/or differential energy allocation between Pinewood River and the Sturgeon Creek reference area.

7.4 Central Mudminnow

Twenty-one female central mudminnow from Pinewood River (effluent-exposed) and 22 from the Sturgeon Creek were collected during the Phase 1 spring fish survey (Appendix Tables E.8 and E.9). In addition, 22 male central mudminnow from Pinewood River (effluent-exposed) and 22 males from Sturgeon Creek were collected (Table 7.4; Appendix Tables E.10 to E.11). All

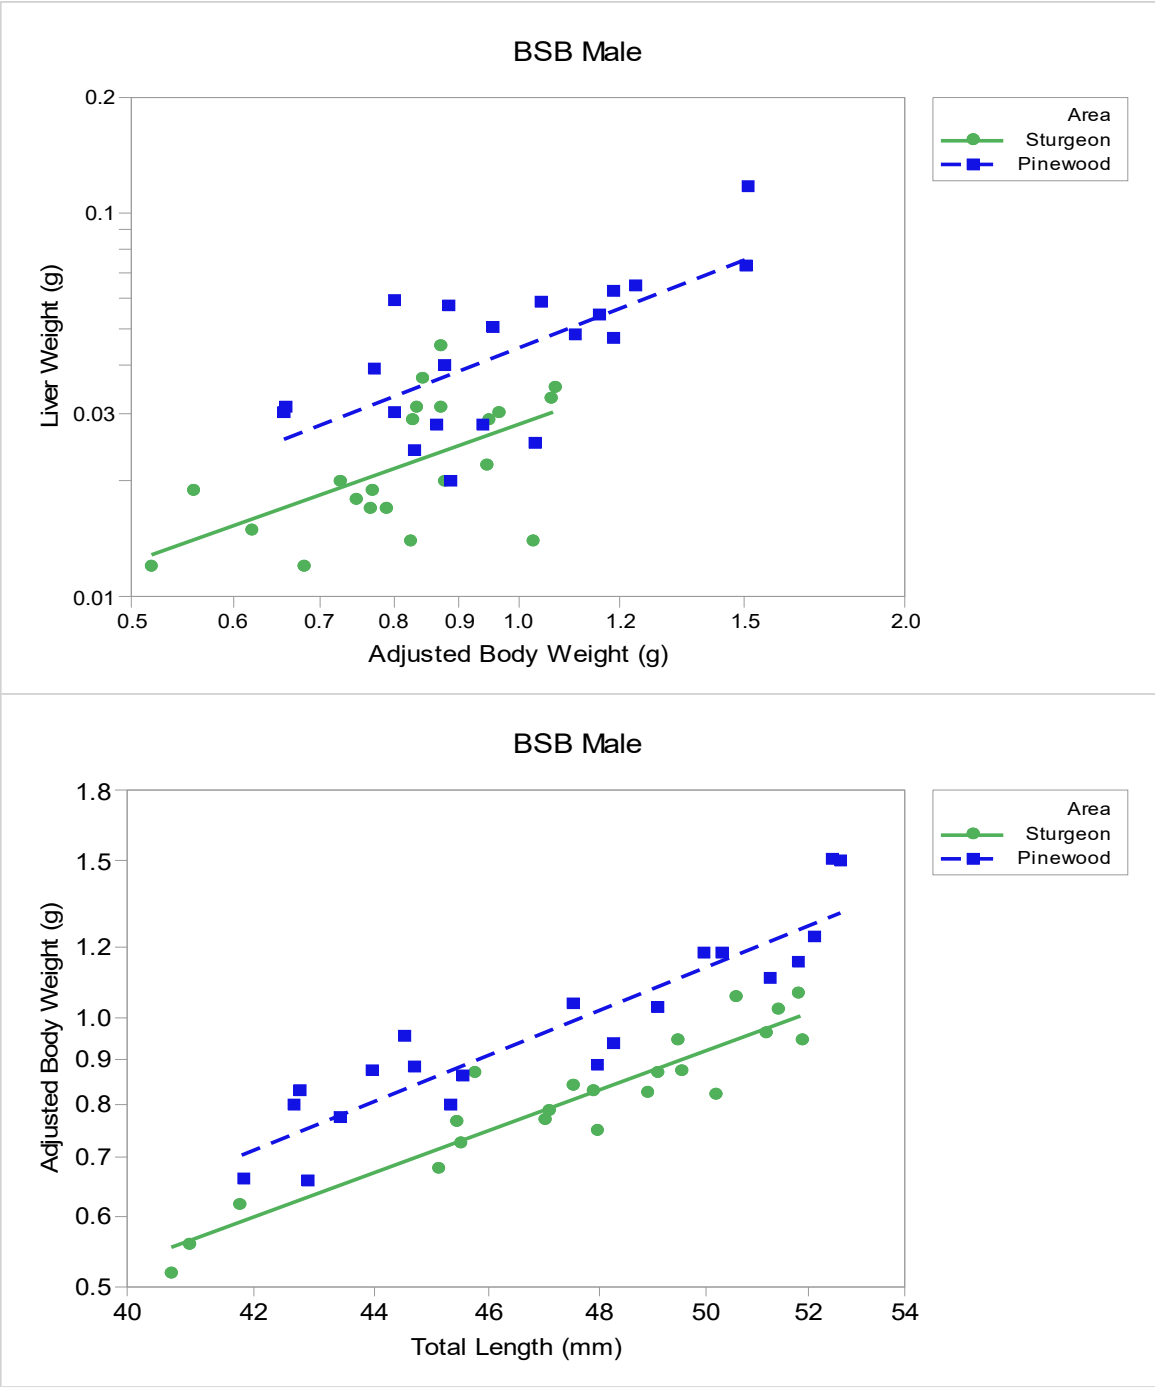

Figure 7.3: Scatterplot and Linear Regressions For Male Brook Stickleback Health Endpoints For Pinewood River (Effluent-exposed) Compared to Sturgeon Creek (Reference), RRP Phase 1 EEM, 2017

Location P-value < 0.1 or Interaction P-value < 0.05

Magnitude of Difference > 25% (or > 10% for Condition), EEM effect endpoints only.

Covariate P-value > 0.05

[a] The mean value of the covariate (that corresponds to the adjusted means for the response variable) for the parallel slope ANCOVA model or the minimum and maximum values of the overlap in covariate values for the interaction ANCOVA model.

[b] The median, mean, and adjusted mean are reported for Mann-Whitney, t-test and ANCOVA, respectively, and the predicted values of the regression line equations for minimum and maximum values of the covariate (where the data sets overlap) for ANCOVAs where a significant interaction (i.e., different slopes) occurs.

[c] The magnitude of difference calculated as: [(exposed area mean - reference area mean) /reference area mean] x 100. When there is a significant interaction in the ANCOVA, the magnitude of difference is calcaulated at the minimum and maximum values of overlap in covariate values as as: [(exposed area predicted value - reference area predicted value) / reference area predicted value] x 100.

collected central mudminnow were subject to measurements needed to calculate the required EEM metrics, which were summarized by sex and area (Appendix Tables E.8 to E.11).

7.4.1 Female Central Mudminnow

Female central mudminnow from the effluent-exposed area did not differ in age relative to those from Sturgeon Creek (Figure 7.4a and Table 7.4). Effluent-exposed female central mudminnow ranged from age 1 to 4 years and the Sturgeon Creek females ranged from 1 to 3 years (Figure 7.4a; Appendix Tables E.8 and E.9).

Growth, as assessed using adjusted body weight-at-age was significantly greater for females captured at Pinewood River when comparing one year olds, but two year old females were slightly smaller and therefore the results are equivocal (Table 7.4 and Figure 7.5).

Relative gonad size and egg weight were both significantly larger in female central mudminnow captured in the Pinewood River than at Sturgeon Creek, with the magnitude of difference outside of applicable CES for overall gonad weight but not for egg weight, with egg weights being effectively identical (Table 7.4 and Figure 7.5; Appendix Tables E.8 and E.9). These data indicated that Pinewood River females possessed proportionally larger ovaries at a given body weight compared to those at Sturgeon Creek, suggesting greater energy allocation towards reproduction. Relative liver size and body condition of female central mudminnow captured at Pinewood River were both significantly greater than those captured at Sturgeon Creek, however the magnitude of difference for both were within the applicable CES suggesting that they may not be ecologically meaningful (Table 7.4 and Figure 7.5; Appendix Tables E.8 and E.9).

Overall, female central mudminnow collected at Pinewood River showed no difference in age, significantly larger relative gonad size, larger relative liver size, and greater body condition compared to those captured at Sturgeon Creek. The survival, reproductive, and energy storage responses in female central mudminnow were very similar to those of brook stickleback between Pinewood River and Sturgeon Creek. As indicated previously, the responses shown in female central mudminnow may have reflected differing food resources/assemblages and/or differential energy allocation between the Pinewood River and the Sturgeon Creek reference area.

7.4.2 Male Central Mudminnow

Male central mudminnow from the effluent-exposed area were of similar age to those from the reference area (Figure 7.4b and Table 7.4). Male central mudminnow ranged from 1 to 4 years at the effluent-exposed area and 1 to 3 years at the reference area (Figure 7.4b; Appendix Tables E.10 and E.11).

b)

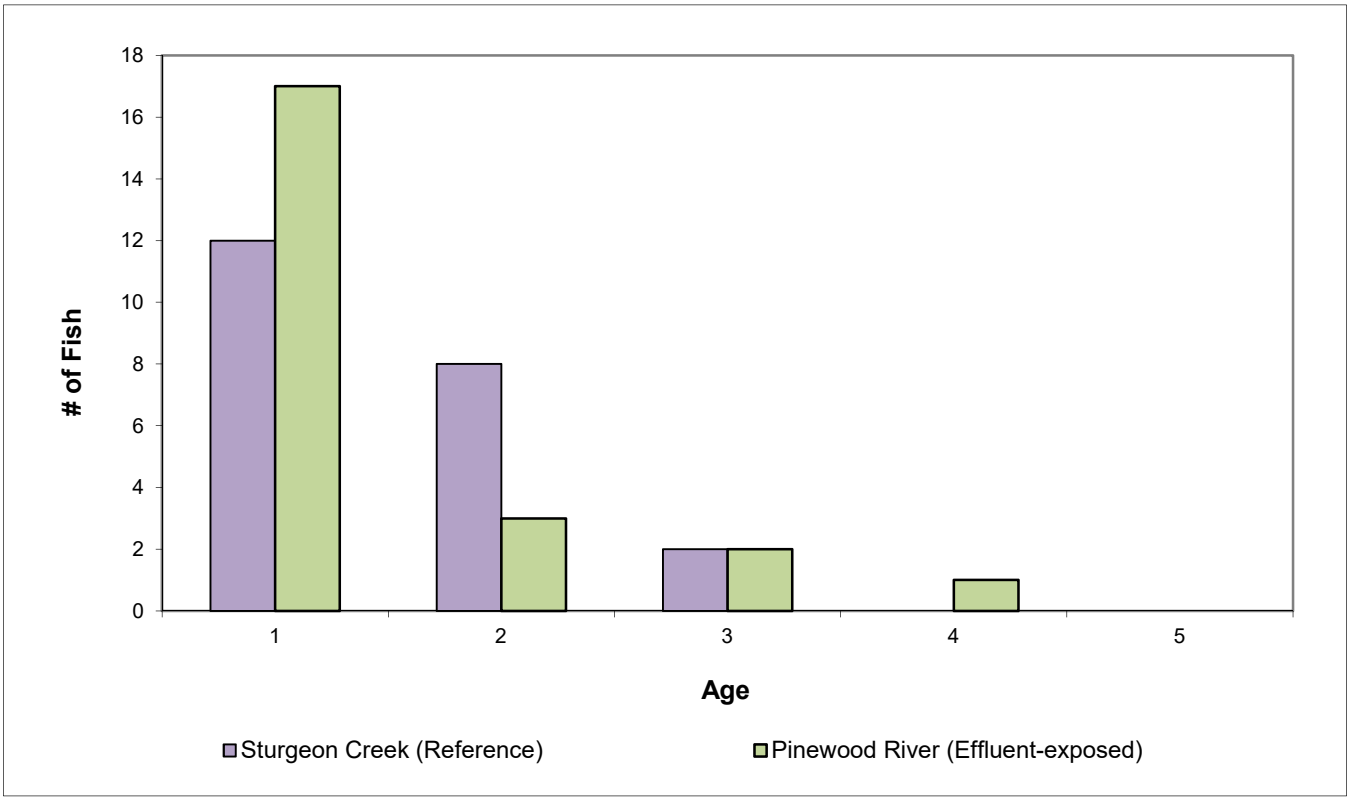

Figure 7.4: Age frequency Distributions of a) Female and b) Male Central Mudminnow in Sturgeon Creek and Pinewood River, RRP Phase 1 EEM, April 2017

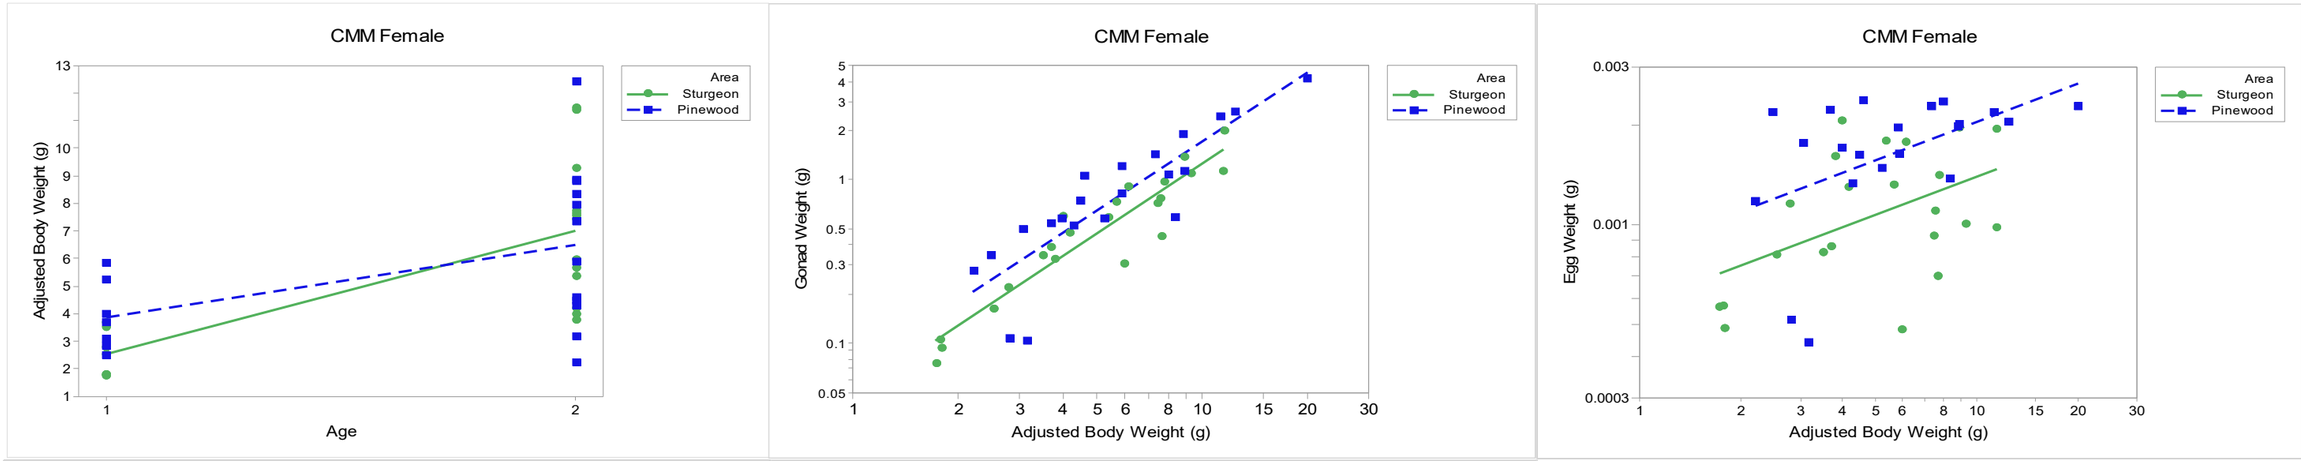

Figure 7.5: Scatterplot and Linear Regressions For Female Central Mudminnow Health Endpoints For Pinewood River (Effluent-exposed) Compared to Sturgeon Creek (Reference), RRP Phase 1 EEM, 2017

Notes: outliers are plotted as open symbols with an × through them

Relative gonad size was not significantly different for male central mudminnow from the Pinewood River compared to those from the reference area (Table 7.4). Relative liver size and body condition of male central mudminnow were both significantly greater than those captured at Sturgeon Creek, with the magnitude of difference for both endpoints outside the applicable CES (Table 7.4 and Figure 7.6; Appendix Tables E.10 and E.11). No abnormalities were observed in the male central mudminnow during the spring survey.

Overall, male central mudminnow collected at the Pinewood River showed no difference in age, but significantly larger livers and body condition compared to those captured at Sturgeon Creek. The survival (age) and energy storage responses shown in male central mudminnow were very similar to those shown in female central mudminnow and both sexes of brook stickleback between Pinewood River and Sturgeon Creek. As indicated previously, the responses shown in male central mudminnow may have reflected differences of food resources/assemblages, and/or differential energy allocation between Pinewood River and the Sturgeon Creek reference area.

7.5 Summary

No major differences in community composition were observed between the two fishing areas, although the effluent-exposed area on the Pinewood River supported the highest species diversity.

Female brook stickleback downstream of the RRP differed significantly from reference female brook stickleback on the basis of relative gonad size, relative live size, and body condition, with the magnitude of differences exceeding the applicable CES. A similar pattern was observed for effluent-exposed female central mudminnow with significant differences in relative gonad size, relative liver size, and body condition; however only relative gonad size was outside of the applicable CES. Effluent-exposed male brook stickleback differed significantly from males captured at the Sturgeon Creek reference on the basis of larger relative liver size and body condition, with the magnitude of difference exceeding the applicable CES for both endpoints. Similarly, male effluent-exposed central mudminnow showed the exact same pattern as the male brook stickleback in terms of significance and magnitude of difference outside of applicable CES.

Overall, fish downstream of the RRP site during the Phase 1 EEM generally showed a similar pattern of survival, reproductive, and energy storage responses when compared to fish captured at the Sturgeon Creek reference area that is suggestive of greater food resource availability.

8 SUMMARY AND CONCLUSIONS

8.1 Conclusions

The RRP Phase 1 EEM field study was implemented in April and September 2017 and provided an integrated assessment of the influence of effluent discharge on the chemical and biological condition of the aquatic receiving environment. The effluent-exposed area on Pinewood River was compared to a reference area located on the Sturgeon Creek, south east of the mine.

Sublethal toxicity tests conducted on grab samples of RRP final effluent at Final Discharge Point 2 (FDP2), and Final Discharge Point 3 (FDP3) over the Phase 1 EEM period (2016 to 2017) indicated that effluent was generally of high quality with the lowest reported effects occurring at effluent concentrations of 37% and 95% for FDP2 and FDP3 respectively, which is above calculated effluent concentrations in the Pinewood River.

Routine water quality monitoring data show that the mine effluent is detectable in Pinewood River, particularly through higher hardness, conductivity, calcium, potassium, and sodium in the effluent-exposed area relative to upstream. Effects on water quality during the field surveys followed a similar pattern that was observed during the routine water quality.

The inorganic sediment fraction was composed predominantly of silt and clay with some sand. There were significant differences between the effluent-exposed and reference area sediments on the basis of total organic carbon, as well as the silt and clay fractions, with significantly more TOC and silt in the effluent-exposed area, and significantly less clay. Sediment chemistry showed two analytes were greater in the effluent-exposed area than in both the reference area and PSQG LEL values (manganese and phosphorus) however this maybe a natural difference between the two areas rather than a mine-related effect. Concentrations of TKN, chromium, and nickel were similar between both areas as well as being elevated compared to PSQG values indicating that these substances are also naturally elevated in these two watercourses.

The benthic invertebrate community in the effluent-exposed area was similar to the reference area for all EEM metrics (mean organism density, number of taxa, and Simpson's Evenness) except Bray-Curtis. Also, Chironomids and Oligochaeta showed comparable percent abundances and were not significantly different among areas. The proportion of pollution-intolerant EPT (Ephemeroptera, Plecoptera, Tricoptera) were similar in percent abundance in the effluent-exposed area compared to the Surgeon Creek, however they were in low abundances for both areas. Correspondence Analysis showed a difference in the Pinewood River effluent-exposed area compared to the community in Sturgeon Creek. The subtle differences observed in the community structure between the areas were most likely related to differences in natural

habitat factors between watersheds (i.e., factors not controlled for in this study) rather than mine-related impacts.

The fish survey showed no major differences in community composition between the two areas although the effluent-exposed area on Pinewood River supported the highest diversity. Female brook stickleback downstream of the RRP differed significantly from reference female brook stickleback for relative gonad size, relative liver size, and body condition, with the magnitude of differences outside of the applicable CES. A similar pattern was observed for effluent-exposed female central mudminnow with significant differences in relative gonad size, relative liver size, and body condition, however only relative gonad size was outside of the applicable CES. Effluent-exposed male brook stickleback were significantly different from male brook stickleback captured at the Sturgeon Creek reference based on larger relative liver size and body condition, with the magnitude of difference outside of the applicable CES for both endpoints. Similarly, male effluent-exposed central mudminnow showed the exact same pattern as the male brook stickleback (larger relative liver size and body condition) in terms of significance and magnitude of difference outside of applicable CES. Although significant differences for several endpoints for both sexes and species were outside of the applicable CES, these differences may be a result of differing food resources/assemblages between the Pinewood River and Sturgeon Creek and not a result of mine-effluent.

8.2 Recommendations

Based on the findings of the Phase 1 RRP EEM study conducted in April and September 2017, it is recommended that the mine implements the Phase 2 EEM biological study ("periodic monitoring - surveillance") three years after Phase 1. A specific recommendation for RRP's Phase 2 EEM is to use the same sentinel fish species and reference areas used in the Phase 1 EEM. This will allow for consistent Phase to Phase comparisons. Additionally, once a permanent final discharge point has been established, the effluent plume should be fully characterized to determine the magnitude and extent of the effluent within the Pinewood River.

B1 INTRODUCTION

B1.1 Overview

Data Quality Assessment (DQA) was conducted on data collected as part of Phase 1 Environmental Effects Monitoring study implemented for the New Gold Rainy River Project. The objective of DQA is to define the overall quality of the data presented in the report, and, by extension, the confidence with which the data can be used to derive conclusions

B1.2 Background

A variety of factors can influence the chemical and biological measurements made in an environmental study and thus affect the accuracy and/or precision of the data. Inconsistencies in sampling or laboratory methods, use of instruments that are inadequately calibrated or which cannot measure to the desired level of accuracy or precision, and contamination of samples in the field or laboratory are just some of the potential factors that can lead to the reporting of data that do not accurately reflect actual environmental conditions. Depending on the magnitude of the problem, inaccuracy or imprecision have the potential to affect the reliability of any conclusions made from the data. Therefore, it is important to ensure that monitoring programs incorporate appropriate steps to control the non-natural sources of data variability (i.e., minimize the variability that does not reflect natural spatial and temporal variability in the environment) and thus assure the quality of the data.

Data quality as a concept is meaningful only when it relates to the intended use of the data. That is, one must know the context in which the data will be interpreted in order to establish a relevant basis for judging whether or not the data set is adequate. DQA involves comparison of actual field and laboratory measurement performance to data quality objectives (DQOs) established for a particular study, such as evaluation of lowest detection limits, and data precision (based on field duplicate samples), along with proper scrutiny of all laboratory data reports.

DQOs were established at the outset of the field program that reflect reasonable and achievable performance expectations (Appendix Table B.1). Programs involving a large amount of samples and analytes usually result in some results that exceed the DQOs. This is particularly so for multi-element scans (e.g., ICP scans for metals) since the analytical conditions are not necessarily optimal for every element included in the scan. Generally, scan results may be considered acceptable if no more than 20% of the parameters fail to meet the DQOs. Overall, the intent of comparing data to DQOs was not to reject any measurement that did not meet the DQO, but to ensure any questionable data received more scrutiny to

determine what effect, if any, this had on interpretation of results within the context of this project.

B1.3 Types of Quality Control Samples

Several types of quality control (QC) samples were assessed based on samples collected (or prepared) in the field and laboratory. These samples, and a description of each, include the following:

- **Blanks** are samples of de-ionized water and/or appropriate reagent(s) that are handled and analyzed the same way as regular samples. These samples will reflect any contamination of samples occurring in the laboratory (in the case of laboratory or method blanks). Analyte concentrations should be non-detectable although a data quality objective of twice the method detection limit allows for slight "noise" around the detection limit.
- **Field Duplicates** are replicate samples collected from a randomly selected field station using identical collection and handling methods or by splitting the same sample which are then analyzed separately in the laboratory. The duplicate samples are handled and analyzed in an identical manner in the laboratory. The data from field replicate samples reflect natural variability, as well as the variability associated with sample collection methods, and therefore provide a measure of field precision.
- **Laboratory Duplicates** are replicate sub-samples created in the laboratory from randomly selected field samples which are sub-sampled and then analyzed independently using identical analytical methods. For fish tissue, laboratory duplicates represent separate aliquots of material collected after sample homogenization. The laboratory duplicate sample results reflect any variability introduced during laboratory sample handling and analysis and thus provide a measure of laboratory precision.
- **Spike Recovery Samples** are created in the laboratory by adding a known amount/concentration of a given analyte (or mixture of analytes) to a randomly selected test sample previously divided to create two sub-samples. The spiked and regular sub-samples are then analyzed in an identical manner. The spike recovery represents the difference between the measured spike amount (total amount in spiked sample minus amount in original sample) relative to the known spike amount (as a percentage). Two types of spike recovery samples are commonly analyzed. Spiked blanks (or blank spikes) are created using laboratory control materials whereas matrix spikes are created using field-collected samples. The analysis of spiked samples provides an indication of the accuracy of analytical results.

- **Certified Reference Materials and QC Standards** are samples containing known chemical concentrations that are processed and analyzed along with batches of environmental samples. The sample results are then compared to target results to provide a measure of analytical accuracy. The results are reported as the percent of the known amount that was recovered in the analysis.

Two types of QC were applied to benthic invertebrate community samples as follows:

- **Organism Recovery** Checks for benthic invertebrate community samples involve the re-processing of previously sorted material from a randomly selected sample to determine the number of invertebrates that were not recovered during the original sample processing. The reprocessing is conducted by an analyst not involved during the original processing to reduce any bias. This check allows the determination of accuracy through assessment of recovery efficiency.
- **Sub-Sampling Error** is assessed for studies in which benthic invertebrate community samples require sub-sampling (due to excessive sample volume and/or invertebrate density). By comparing the numbers of benthic invertebrates recovered between at least two sub-samples, this measure provides an evaluation of how effective the sub-sampling method was in evenly dividing the original sample. Therefore, sub-sampling error provides a measure of analytical accuracy and precision. The processing of entire benthic invertebrate community samples in representative sample fractions also allows an evaluation of sub-sampling accuracy.

One additional types of QC measures was applied to the fish fecundity samples as follows:

- **Egg Re-count** for collected fish gonad tissue involves the reprocessing of previously counted eggs to ensure that the initial count was accurate. The re-count is completed on a randomly selected sample and reprocessing is conducted by an analyst not involved during the original count to reduce any bias.

B2 WATER SAMPLES

B2.1 Lowest Detection Limits

Target laboratory lowest detection limits (LDL) for water sample analyses were established at levels below all potentially applicable water quality guidelines (Appendix Table B.2). All reported LDLs were at or below the applicable water quality guidelines meaning that sample data for this project could be reliably interpreted relative to the guidelines.

B2.2 Field Duplicate Samples

Two sets of duplicate water samples were collected in the field (one in April and one in the September), which showed good agreement in analyte concentrations (Appendix Table B.3). In the April sample, one analyte that did not achieve the DQO, this was total dissolved solids. In the September sample, four analytes did not achieve the DQO; total ammonia, nitrate, sulfate, and sulfur. Although total dissolved solids, total ammonia, sulfate, and sulfur did not achieve the DQO, the absolute difference in concentration between the duplicate samples was very low. Nitrate also failed to meet the DQO and had relatively high absolute differences in concentration; this is possibly because the duplicate sample was not fully preserved, therefore microbial action continued, leading to continued nitrogen fixation (i.e. increased nitrate). Overall, the data suggest that reported sample data were reasonably precise representations of conditions at the time of sampling.

B3 SEDIMENT SAMPLES

B3.1 Lowest Detection Limits

Target laboratory lowest detection limits (LDL) for sediment sample analyses were established at levels below all potentially applicable sediment quality guidelines (Appendix Table B.4). None of the reported LDLs were at or above the target concentrations meaning that sample data for this project could be reliably interpreted relative to the guidelines (Sediment Quality Guidelines; Appendix Table B.4).

B3.2 Field Duplicate Samples

One field duplicate sediment sample was collected for this project. All parameters achieved close agreement indicating good precision (Appendix Table B.5).

B4 BENTHIC MACROINVERTEBRATE SAMPLES

B4.1 Subsampling Accuracy and Precision

Three samples were fractioned and sorted in its entirety for QC purposes. The DQO of 20% was met for both precision and accuracy for two of the three samples, the lab indicated that the probability of meeting the accuracy criteria is reduced, due to the low organism densities. (Appendix Table B.6a and Table B.6c). Overall, the number of organisms in each fraction showed close agreement.

B4.2 Organism Recovery

The data quality objective for percent organism recovery was met for both samples that were re-sorted (Appendix Table B.6b).

B5 FISH SAMPLES

B5.1 Fecundity

The relative percent differences between original and resorted fecundity estimates, based on five brook stickleback and four central mudminnow ovaries, were good (Appendix Table B.7). All but three samples achieved the DQO. Overall, the duplicate results indicated good precision.

B6 DATA QUALITY STATEMENT

The quality of data for this project was adequate to serve the project objective.

Table B.1: Data Quality Objectives for Environmental Samples Collected for the RRP Phase 1 EEM, 2017

Quality Control Measure	Quality Control Sample Type	Study Component			
		Water Quality	Sediment Quality	Benthic Invertebrate Community	Fish Fecundity

[a] Relative Percent Difference = [absolute (replicate1-replicate2)/average (replicate1,replicate2)]*100

[b] The laboratory detection limit (LDL) value was used in instances where values less than the LDL were reported.

Table B.6a: Calculation of Subsampling Error for Benthic Macroinvertebrate Samples

Station ID	Whole Organisms	Number of Organisms in Fraction 1	Number of Organisms in Fraction 2	Number of Organisms in Fraction 3	Number of Organisms in Fraction 4	Actual Density	Precision % range		Accuracy	
									min	max
StuC-REF-2	0	36	38	0	0	74	5.3	-	2.7	2.7
StuC-REF-3	0	24	31	0	0	55	22.6	-	12.7	12.7
PinR-EXP-5	0	14	24	0	0	38	41.7	-	26.3	26.3

Note: Highlighted Values did not Meet the Data Quality Objective of ≤ 20% Difference.
min = minimum absolute % error; max = maximum absolute % error.

Table B.6b: Percent Recovery of Benthic Macroinvertebrates

Station ID	Number of Organisms Recovered (initial sort)	Number of Organisms in Re-sort	Percent Recovery
StuC-REF-4	42	42	100.0%
PinR-EXP-2	89	94	94.7%
		Average % Recovery	97.4%

Note: Highlighted Values did not Meet the Data Quality Objective of 90% Recovery.

Table B.6c: Sample Fractions Sorted from RRP Phase 1 EEM Samples

Station ID	Fraction Sorted	Station	Fraction Sorted
StuC-REF-1	1/16	PinR-EXP-1	1/16
StuC-REF-2	1/8[a]	PinR-EXP-2	1/16
StuC-REF-3	1/8[a]	PinR-EXP-3	1/16
StuC-REF-4	1/16	PinR-EXP-4	1/16
StuC-REF-5	1/16	PinR-EXP-5	1/8[a]

[a] three eighths sorted for subsampling error calculations.

QA/QC Notes

Reported fractions averaged 4 hours to sort due to high quantities of organic matter. ZEAS has shown that subsampling precision and accuracy are density dependent (Zaranko and Keene 2005). Specifically, small absolute differences between subsampled fractions become increasingly large, when expressed as a percentage of total organisms, as organism densities decline. Therefore, the probability of meeting precision and accuracy criteria is reduced in samples with low organism densities (i.e., <150 organisms/subsample). It would take an extaordinary effort (>20 hours) to report accuracy on 1/8ths or smaller fractions. Based on the low densities, there would be a low probability of attaining the accuracy criteria.

Zaranko, D.T. and J. Keene. 2005. Are the costs to meet environmental effects monitoring (EEM) benthic sample precision and accuracy criteria justified? In Dixon, D.G., S. Munro and A.J. Niimi (eds). Proceedings of the 32nd Annual Aquatic Toxicity Workshop: October 3 to 5, 2005, Waterloo, Ontario. Can. Tech. Rep. Fish. Aquat. Sci: 2617. 120p.

Table B.7: Relative Percent Difference Between Original Egg Count and Recount Values

Sample	Egg Count (min. 100 eggs counted)			Egg Re-count			Relative Percent Difference[a]		
	1	2	3	1	2	3	1	2	3
PinR-BSB-03	124	130	103	121	125	101	2	4	2

Reference Information

QC Samples with Qualifiers & Comments:

QC Type Description	Parameter	Qualifier	Applies to Sample Number(s)
Matrix Spike	Dissolved Organic Carbon	MS-B	L1917630-1, -2, -3, -4
Matrix Spike	Calcium (Ca)-Dissolved	MS-B	L1917630-1, -2, -3, -4
Matrix Spike	Magnesium (Mg)-Dissolved	MS-B	L1917630-1, -2, -3, -4
Matrix Spike	Total Organic Carbon	MS-B	L1917630-1, -2, -3, -4

Sample Parameter Qualifier key listed:

Qualifier	Description
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-TB	Water	Alkalinity	APHA 2320B modified

This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.

CL-L-IC-N-TB	Water	Chloride in Water by IC (Low Level)	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

CN-T-CFA-TB	Water	Total Cyanide by CFA	ISO 14403-2:2012 (modified)

This analysis is carried out using procedures adapted from ISO Method 14403:2002 "Determination of Total Cyanide using Flow Analysis (FIA and CFA)". Total or strong acid dissociable (SAD) cyanide is determined by in-line UV digestion along with sample distillation and final determination by colourimetric analysis.
Method Limitation: This method is susceptible to interference from thiocyanate (SCN). If SCN is present in the sample, there could be a positive interference with this method, but it would be less than 1% and could be as low as zero.

CN-WAD-CFA-TB	Water	Weak Acid Dissociable Cyanide by CFA	APHA 4500-CN CYANIDE (modified)

This analysis is carried out using procedures adapted from APHA Method 4500-CN I. "Weak Acid Dissociable Cyanide". Weak Acid Dissociable (WAD) cyanide is determined by in-line sample distillation with final determination by colourimetric analysis.

DOC-TB	Water	Dissolved Organic Carbon	APHA 5310 B modified

Water samples are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. Analyzed by converting all carbonaceous material to carbon dioxide (CO2) by catalytic combustion at 850?C. The CO2 generated is measured by an infrared detector and is directly proportional to concentration of carbonaceous material in the sample

ETL-N2N3-TB	Water	Calculate from NO2 + NO3	Calculation
F-IC-N-TB	Water	Fluoride in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

HARDNESS-CALC-TB	Water	Hardness (as CaCO3)	CALCULATION
HG-T-CVAF-TB	Water	Total Mercury in Water by CVAFS	EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAFS.

MET-D-CCMS-TB	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-TB	Water	Total Metals in Water by CRC ICPMS	EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

NH3-COL-TB	Water	Ammonia by Discrete Analyzer	APHA 4500-NH3 G. (modified)

Ammonia in aqueous matrices is analyzed using discrete analyzer with colourimetric detection.

NO2-IC-N-TB	Water	Nitrite in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-IC-N-TB	Water	Nitrate in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

P-T-COL-TB	Water	Total Phosphorus by Discrete Analyzer	APHA 4500-P B, F, G (modified)

Phosphorus in aqueous matrices is analyzed using discrete Analyzer with colourimetric detection.

SO4-IC-N-TB	Water	Sulfate in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

Reference Information

TDS-TB	Water	Total Dissolved Solids	APHA 2540 C (modified)

Aqueous matrices are analyzed using gravimetry and evaporation

TOC-TB	Water	Total Organic Carbon (TOC)	APHA 5310 B modified

Water samples are analyzed by converting all carbonaceous material to carbon dioxide (CO2) by catalytic combustion at 850?C. The CO2 generated is measured by an infrared detector and is directly proportional to concentration of carbonaceous material in the sample

TSS-TB	Water	Total Suspended Solids	APHA 2540 D (modified)

Aqueous matrices are analyzed using gravimetry

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
TB	ALS ENVIRONMENTAL - THUNDER BAY, ONTARIO, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid weight of sample
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Quality Control Report

Legend:

Limit	ALS Control Limit (Data Quality Objectives)
DUP	Duplicate
RPD	Relative Percent Difference
N/A	Not Available
LCS	Laboratory Control Sample
SRM	Standard Reference Material
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ADE	Average Desorption Efficiency
MB	Method Blank
IRM	Internal Reference Material
CRM	Certified Reference Material
CCV	Continuing Calibration Verification
CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Sample Parameter Qualifier Definitions:

Qualifier	Description
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported: unless indicated otherwise, associated sample data are not blank corrected.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.
(1) Radium-226 results have not been corrected for blanks.

4965003	FA5	RPD	Radium-226	2017/05/09	NC		%	N/A

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

Matrix Spike	Strontium (Sr)-Total	MS-B	L1991701-1, -2, -3, -4
Matrix Spike	Tungsten (W)-Total	MS-B	L1991701-1, -2, -3, -4
Matrix Spike	Total Organic Carbon	MS-B	L1991701-1, -2, -3, -4

Sample Parameter Qualifier key listed:

Qualifier	Description
B	Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
RRV	Reported Result Verified By Repeat Analysis

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
ALK-TITR-TB	Water	Alkalinity	APHA 2320B modified

This analysis is carried out using procedures adapted from APHA Method 2320 "Alkalinity". Total alkalinity is determined by potentiometric titration to a pH 4.5 endpoint. Bicarbonate, carbonate and hydroxide alkalinity are calculated from phenolphthalein alkalinity and total alkalinity values.

CL-L-IC-N-TB	Water	Chloride in Water by IC (Low Level)	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

CN-TOT-WT	Water	Cyanide, Total	ISO 14403-2

Total cyanide is determined by the combination of UV digestion and distillation. Cyanide is converted to cyanogen chloride by reacting with chloramine-T, the cyanogen chloride then reacts with a combination of barbituric acid and isonicotinic acid to form a highly colored complex.

When using this method, high levels of thiocyanate in samples can cause false positives at ~1-2% of the thiocyanate concentration. For samples with detectable cyanide analyzed by this method, ALS recommends analysis for thiocyanate to check for this potential interference

CN-WAD-WT	Water	Cyanide, Weak Acid Diss	APHA 4500CN I-Weak acid Dist Colorimet

Weak acid dissociable cyanide (WAD) is determined by undergoing a distillation procedure. Cyanide is converted to cyanogen chloride by reacting with chloramine-T, the cyanogen chloride then reacts with a combination of barbituric acid and isonicotinic acid to form a highly colored complex.

DOC-TB	Water	Dissolved Organic Carbon	APHA 5310 B modified

Water samples are determined by filtering the sample through a 0.45 micron membrane filter prior to analysis. Analyzed by converting all carbonaceous material to carbon dioxide (CO2) by catalytic combustion at 850?C. The CO2 generated is measured by an infrared detector and is directly proportional to concentration of carbonaceous material in the sample

F-IC-N-TB	Water	Fluoride in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

HARDNESS-CALC-TB	Water	Hardness (as CaCO3)	CALCULATION

HG-T-CVAF-TB	Water	Total Mercury in Water by CVAFS	EPA 1631E (mod)

Water samples undergo a cold-oxidation using bromine monochloride prior to reduction with stannous chloride, and analyzed by CVAFS.

MET-D-CCMS-TB	Water	Dissolved Metals in Water by CRC ICPMS	APHA 3030B/6020A (mod)

Water samples are filtered (0.45 um), preserved with nitric acid, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

MET-T-CCMS-TB	Water	Total Metals in Water by CRC ICPMS	EPA 200.2/6020A (mod)

Water samples are digested with nitric and hydrochloric acids, and analyzed by CRC ICPMS.

Method Limitation (re: Sulfur): Sulfide and volatile sulfur species may not be recovered by this method.

Reference Information

NH3-COL-TB	Water	Ammonia by Discrete Analyzer	APHA 4500-NH3 G. (modified)

Ammonia in aqueous matrices is analyzed using discrete analyzer with colourimetric detection.

NO2-IC-N-TB	Water	Nitrite in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

NO3-IC-N-TB	Water	Nitrate in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

P-T-COL-TB	Water	Total Phosphorus by Discrete Analyzer	APHA 4500-P B, F, G (modified)

Phosphorus in aqueous matrices is analyzed using discrete Analyzer with colourimetric detection.

SO4-IC-N-TB	Water	Sulfate in Water by IC	EPA 300.1 (mod)

Inorganic anions are analyzed by Ion Chromatography with conductivity and/or UV detection.

TDS-TB	Water	Total Dissolved Solids	APHA 2540 C (modified)

Aqueous matrices are analyzed using gravimetry and evaporation

TOC-TB	Water	Total Organic Carbon (TOC)	APHA 5310 B modified

Water samples are analyzed by converting all carbonaceous material to carbon dioxide (CO_2) by catalytic combustion at 850?C. The CO_2 generated is measured by an infrared detector and is directly proportional to concentration of carbonaceous material in the sample

TSS-TB	Water	Total Suspended Solids	APHA 2540 D (modified)

Aqueous matrices are analyzed using gravimetry

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
WT	ALS ENVIRONMENTAL - WATERLOO, ONTARIO, CANADA
TB	ALS ENVIRONMENTAL - THUNDER BAY, ONTARIO, CANADA

Chain of Custody Numbers:

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid weight of sample
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Quality Control Report

Legend:

Limit	ALS Control Limit (Data Quality Objectives)
DUP	Duplicate
RPD	Relative Percent Difference
N/A	Not Available
LCS	Laboratory Control Sample
SRM	Standard Reference Material
MS	Matrix Spike
MSD	Matrix Spike Duplicate
ADE	Average Desorption Efficiency
MB	Method Blank
IRM	Internal Reference Material
CRM	Certified Reference Material
CCV	Continuing Calibration Verification
CVS	Calibration Verification Standard
LCSD	Laboratory Control Sample Duplicate

Sample Parameter Qualifier Definitions:

Qualifier	Description
B	Method Blank exceeds ALS DQO. Associated sample results which are < Limit of Reporting or > 5 times blank level are considered reliable.
MS-B	Matrix Spike recovery could not be accurately calculated due to high analyte background in sample.
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

Remarks:

Maxxam Analytics' laboratories are accredited to ISO/IEC 17025:2005 for specific parameters on scopes of accreditation. Unless otherwise noted, procedures used by Maxxam are based upon recognized Provincial, Federal or US method compendia such as CCME, MDDELCC, EPA, APHA.

All work recorded herein has been done in accordance with procedures and practices ordinarily exercised by professionals in Maxxam's profession using accepted testing methodologies, quality assurance and quality control procedures (except where otherwise agreed by the client and Maxxam in writing). All data is in statistical control and has met quality control and method performance criteria unless otherwise noted. All method blanks are reported: unless indicated otherwise, associated sample data are not blank corrected.

Maxxam Analytics' liability is limited to the actual cost of the requested analyses, unless otherwise agreed in writing. There is no other warranty expressed or implied. Maxxam has been retained to provide analysis of samples provided by the Client using the testing methodology referenced in this report. Interpretation and use of test results are the sole responsibility of the Client and are not within the scope of services provided by Maxxam, unless otherwise agreed in writing.

Solid sample results, except biota, are based on dry weight unless otherwise indicated. Organic analyses are not recovery corrected except for isotope dilution methods.
Results relate to samples tested.
This Certificate shall not be reproduced except in full, without the written approval of the laboratory.
Reference Method suffix "m" indicates test methods incorporate validated modifications from specific reference methods to improve performance.
(1) Radium-226 results have not been corrected for blanks.

5173929	FA5	Method Blank	Radium-226	2017/09/27	<0.010		Bq/L	
5173929	FA5	RPD	Radium-226	2017/09/27	NC		%	N/A

N/A = Not Applicable

Duplicate: Paired analysis of a separate portion of the same sample. Used to evaluate the variance in the measurement.

Spiked Blank: A blank matrix sample to which a known amount of the analyte, usually from a second source, has been added. Used to evaluate method accuracy.

Method Blank: A blank matrix containing all reagents used in the analytical procedure. Used to identify laboratory contamination.

NC (Duplicate RPD): The duplicate RPD was not calculated. The concentration in the sample and/or duplicate was too low to permit a reliable RPD calculation (absolute difference <= 2x RDL).

Email 2: kbatchelar@minnow.ca

Select Service Level Below - Please confirm all E&P TATs with your AM - surcharges will apply

Regular [R] ☑ Standard TAT if received by 3 pm - business days - no surcharges apply

PRIORITY (Business Days): 4 day [P4] ☐ | 3 day [P3] ☐ | 2 day [P2] ☐

EMERGENCY: 1 Business day [E1] ☐ | Same Day, Weekend or Statutory holiday [E0] ☐

Date and Time Required for all E&P TATs: dd-mmm-yy hh:mm

For tests that can not be performed according to the service level selected, you will be contacted.

* Refer to Referenced Information for Qualifiers (if any) and Methodology.

Reference Information

Sample Parameter Qualifier key listed:

Qualifier	Description
DLHC	Detection Limit Raised: Dilution required due to high concentration of test analyte(s).

Test Method References:

ALS Test Code	Matrix	Test Description	Method Reference**
C-TIC-PCT-SK	Soil	Total Inorganic Carbon in Soil	CSSS (2008) P216-217
A known quantity of acetic acid is consumed by reaction with carbonates in the soil. The pH of the resulting solution is measured and compared against a standard curve relating pH to weight of carbonate.			
C-TOC-CALC-SK	Soil	Total Organic Carbon Calculation	CSSS (2008) 21.2
Total Organic Carbon (TOC) is calculated by the difference between total carbon (TC) and total inorganic carbon. (TIC)			
C-TOT-LECO-SK	Soil	Total Carbon by combustion method	CSSS (2008) 21.2
The sample is ignited in a combustion analyzer where carbon in the reduced CO2 gas is determined using a thermal conductivity detector.			
FOC-CALC-SK	Soil	Fraction of Organic Carbon - Calculation	AUTO CALCULATION
HG-200.2-CVAA-SK	Soil	Mercury in Soil by CVAAS	EPA 200.2/1631E (mod)
Soil samples are digested with nitric and hydrochloric acids, followed by analysis by CVAAS.			
IC-CACO3-CALC-SK	Soil	Inorganic Carbon as CaCO3 Equivalent	Calculation
MET-200.2-CCMS-SK	Soil	Metals in Soil by CRC ICPMS	EPA 200.2/6020A (mod)
This method uses a heated strong acid digestion with HNO3 and HCl and is intended to liberate metals that may be environmentally available. Silicate minerals are not solubilized. Dependent on sample matrix, some metals may be only partially recovered, including Al, Ba, Be, Cr, Sr, Ti, Tl, V, W, and Zr. Volatile forms of sulfur (including sulfide) may not be captured, as they may be lost during sampling, storage, or digestion. Analysis is by Collision/Reaction Cell ICPMS.			
MOIST-SK	Soil	Moisture Content	ASTM D2216-80
The weighed portion of soil is placed in a 105°C oven overnight. The dried soil is allowed to cooled to room temperature, weighed and the % moisture is calculated.			
N-TOTKJ-COL-SK	Soil	Total Kjeldahl Nitrogen	CSSS (2008) 22.2.3
The soil is digested with sulfuric acid in the presence of CuSO4 and K2SO4 catalysts. Ammonia in the soil extract is determined colrimetrically at 660 nm.			
PSA-PIPET+GRAVEL-SK	Soil	Particle size - Sieve and Pipette	SSIR-51 METHOD 3.2.1
Particle size distribution is determined by a combination of techniques. Dry sieving is performed for coarse particles, wet sieving for sand particles and the pipette sedimentation method for clay particles.

** ALS test methods may incorporate modifications from specified reference methods to improve performance.

The last two letters of the above test code(s) indicate the laboratory that performed analytical analysis for that test. Refer to the list below:

Laboratory Definition Code	Laboratory Location
SK	ALS ENVIRONMENTAL - SASKATOON, SASKATCHEWAN, CANADA

Chain of Custody Numbers:

Reference Information

GLOSSARY OF REPORT TERMS

Surrogates are compounds that are similar in behaviour to target analyte(s), but that do not normally occur in environmental samples. For applicable tests, surrogates are added to samples prior to analysis as a check on recovery. In reports that display the D.L. column, laboratory objectives for surrogates are listed there.
mg/kg - milligrams per kilogram based on dry weight of sample
mg/kg wwt - milligrams per kilogram based on wet weight of sample
mg/kg lwt - milligrams per kilogram based on lipid weight of sample
mg/L - unit of concentration based on volume, parts per million.
< - Less than.
D.L. - The reporting limit.
N/A - Result not available. Refer to qualifier code and definition for explanation.

Test results reported relate only to the samples as received by the laboratory.
UNLESS OTHERWISE STATED, ALL SAMPLES WERE RECEIVED IN ACCEPTABLE CONDITION.
Analytical results in unsigned test reports with the DRAFT watermark are subject to change, pending final QC review.

Sample Parameter Qualifier Definitions:

Qualifier	Description
RPD-NA	Relative Percent Difference Not Available due to result(s) being less than detection limit.

Hold Time Exceedances:

All test results reported with this submission were conducted within ALS recommended hold times.

ALS recommended hold times may vary by province. They are assigned to meet known provincial and/or federal government requirements. In the absence of regulatory hold times, ALS establishes recommendations based on guidelines published by the US EPA, APHA Standard Methods, or Environment Canada (where available). For more information, please contact ALS.

The ALS Quality Control Report is provided to ALS clients upon request. ALS includes comprehensive QC checks with every analysis to ensure our high standards of quality are met. Each QC result has a known or expected target value, which is compared against pre-determined data quality objectives to provide confidence in the accuracy of associated test results.

Please note that this report may contain QC results from anonymous Sample Duplicates and Matrix Spikes that do not originate from this Work Order.

[a] p-value obtained from 1-way ANOVA

[b] Magnitude calculated by comparing the difference between the reference and exposure area means to the reference area standard deviation (SD) [(exposure mean - reference mean) / standard deviation of the reference mean]

[c] Minimum effect size detectable calculated based on variance as square root of MSE from ANOVA and alpha = beta = 0.10. Minimum effect size reported as the minimum number of standard deviations detectable based on reference area standard deviation.

Shading denotes significant interaction (P < 0.05).

Licence to Collect Fish for Scientific Purposes

Permis pour faire la collecte de poissons à des fins scientifiques

Licence No. / N° de permis	1086615
Local Reference No. / N° de référence local	2017-2245
Issuer Account No. / N° de compte du délivreur de permis.	10003046

This licence is issued under Part I of the Fish Licensing Regulation made under the Fish and Wildlife Conservation Act, 1997 to:

Ce permis est délivré en vertu de la Partie I du règlement sur la délivrance de permis de pêche formulé conformément à la Loi sur la protection du poisson et de la faune de 1997 à:

	Last Name / Nom de famille	First Name / Prénom	Middle Name / Second Prénom
Name of Licencee / Nom du titulaire du permis	Mrs. Tester	Jess	

Name of Business/Organization/Affiliation (If applicable) / Nom de l'entreprise/de l'organisme/de l'affiliation (le cas échéant)

Minnow Enviromental Inc.

Mailing address of Licencee / ***Adresse postale du titulaire du permis***

Street Name & No./PO Box/RR#/Gen. Del./ N° rue/C.P./R.R./poste restante

2 Lamb Street

City/Town/Municipality / Ville/village/municipalité	Province/State / Province/État	Postal Code/Zip Code / Code Postal/Zip
Georgetown	ON	L7G 3M9

to collect the species, size and quantites of fish from the waters as set out below.
Pour faire la collecte des espèces suivantes (stade et nombre indiqués ci-dessous):

Species / Espèces	Eggs / Oeuf X	Juvenile / Fretin X	Adults / Adulte X	Numbers / Nombre	Name of Waterbody / Nom de l'étendue d'eau
SMALL BODIED SPECIES			X	50	Pineewood River
SMALL BODIED SPECIES			X	50	Sturgeon Creek or Kishkakoesis River

Yes/Oui ☐ Additional species/Waterbody list attached / Liste d'espèces/d'étendue d'eau additionnelles ci-jointe

Purpose of collection / ***But de la collecte***: Fish population survey

Licence Dates / ***Dates du permis***	Effective Date / Date d'entrée en vigueur (YYYY-MM-DD)	Expiry Date / Date d'expiration (YYYY-MM-DD)
	2017-04-18	2017-05-31

Licence conditions This licence is subject to the conditions contained in Schedule A if included. / Ce permis doit respecter les conditions de l'annexe A si celle-ci est jointe.

Personal information contained on this form is collected under the authority of the Fish and Wildlife Conservation Act, 1997 and will be used for the purpose of licencing, identification, enforcement, resource management and customer service surveys. Please direct further inquiries to the District Manager of the MNR issuing district.

Les renseignements personnels dans ce formulaire sont recueillis conformément à la Loi sur la protection du poisson de la faune, 1997 , et ils seront utilisés aux fins de délivrance de permis, d'identification, d'application des règlements, de gestion des ressources et de sondage sur les services a la clientèle. Veuillez communiquer avec le chef du district du MRN qui délivré le permis si vous avez des questions.

Ontario

Licence to Collect Fish for Scientific Purposes
Schedule A – Licence Conditions

Licence No. 1086615
Local Reference No. 2017-2245
Issuer Account No. 10003046

This licence is subject to the conditions listed below.

1. Mandatory report forms documenting the sampling conducted under this licence must be submitted to the licence issuer within 30 days of the termination date, but in no case later than January 31 next following the year of issue. The digital Mandatory Report form (Part 1) must be completed for each Sampling Program and the digital Site Collection Reports (Part 2) must be completed for each collection site. A separate map clearly indicating the location of each collection site must be attached to the Site Collection Reports. Submit Mandatory Report forms to the Fort Frances District MNRF office. The submission of a satisfactory report is a prerequisite to any subsequent renewals.

2. Sampling locations must be reported using GPS location data using: Projection: Universal Transverse Mercator (UTM); Datum: North American 1983 (NAD83), Canadian Transformation (CNT); Zone: 15 N; Units: metres.

3. Before carrying out any operation under this licence, any person authorized under this licence is required to consult with the Fort Frances Ministry of Natural Resources District Manager at least one week prior to anticipated start of sampling and obtain approval from the respective Manager for the proposed sampling activity. Also, any person authorized under this licence must advise the respective Manager of the date, time and location of all sampling.

4. A copy of the signed original licence must be carried by the licenced person when working at the designated sites. An assistant of the licenced person who is carrying out activities under this licence during the absence of the licenced person shall carry the licence on his or her person.

5. All collection gear shall be clearly marked with the licenced person's and the organization's name.

6. This licence is not valid in Provincial Parks, park reserves, Conservation Authority property or National Parks without written permission from the authorized person in charge of the area concerned.
http://www.ontarioparks.com/email/research

7. Capture gear shall be inspected regularly and live holding traps must be inspected at least once daily.

8. This licence does not allow access to any property without permission of the landowner.

9. The licensee shall follow the best management practices for the collection, handling, transportation and holding of fish identified in **FPS Technical Bulletin (Dec. 15, 2011)** included with the licence in order to minimize the risk of spreading aquatic invasive species and diseases.

10. All field equipment must be de-contaminated prior to use on each water body in order to prevent the spread of exotic species and disease.

11. This licence does not authorize any activity that is prohibited under the federal ***Species at Risk Act*** or the provincial ***Endangered Species Act.***

12. All SAR fish and mussels must also be reported to the OMNR Natural Heritage Information Centre on the appropriate form at:
http://nhic.mnr.gov.on.ca/MNR/nhic/species/species_report.cfm

13. This licence does not authorize the possession of specially protected fish under the ***Ontario Fishery Regulations.***

14. This licence does not authorize the collection of any species of fish protected under the ***Species at Risk Act, Endangered Species Act, or Ontario Fishery Regulations.*** If these species are accidentally captured they must be returned to the water immediately.

15. **This licence ONLY allows for the following capture gear to be used:**

    Minnow traps, seine nets, mini hoop nets, backpack electrofishing

16. **Persons authorized under this licence include the following:**

    Jess Tester, Kevin Martens, Katharina Batchelar, Tyler Nash, Tyrell Worrall, Mike White

17. ***The following MNRF Class Animal Care Protocols will be adhered to as appropriate for the project activity:***
    - ***Capture Methods- Electrofishing***
    - ***Capture Methods- Seining***
    - ***Capture Methods- Impounding Gear***
    - ***Handling and Marking- Biological Sampling***
    - ***Containment- Short term Containment***

Executive Summary

New Gold Inc. (New Gold) has constructed, is now operating, and will eventually reclaim a new open pit and underground gold mine, the Rainy River Mine (RRM), with processing plant and related infrastructure. The RRM site is located in the Township of Chapple, District of Rainy River, in northwestern Ontario, approximately 65 kilometres (km) northwest of Fort Frances, and 420 km west of Thunder Bay. Construction of the RRM began in the winter of 2015, normal operations and production began in 2017.

Regular baseline and monitoring studies have been undertaken since 2009 and have established a comprehensive understanding of the local environment. As part of the Federal environmental assessment process, New Gold committed to follow-up monitoring programs focusing on avian populations to verify the accuracy of the environmental assessment predictions. The current report provides the methods and results from the 2018 wildlife follow-up monitoring program and some initial statistical comparisons to baseline and construction years.

Avian morning point count stations were surveyed in 2014, 2015 (baseline), 2016 (construction) and 2018 (post-construction) to allow for comparisons across years, and the potential to assess any changes in the distribution, abundance, density and richness of species over time within the impact areas as well as areas outside the impact zone(control areas). Impact stations were located around the periphery of the mine site, whereas control stations were located at least 5 km from the mine site.

Data analysis of species distribution, abundance, density and richness were conducted to evaluate temporal and spatial effects of the RRM construction and operation on dominant avian species as well as to identify potential effects on primary avian guilds based on habitat preference.

The comparison of avian populations across survey years suggests that the RRM operations have not significantly adversely affected avian populations in the long term. Half of the most commonly occurring species evaluated experienced no interaction effects on abundance or density, suggesting that the RRM has not had an adverse effect on several of the most commonly occurring species. The other half of the most common species had interaction effects indicating the RRM had some effect on their populations. Some species appear to have been displaced temporarily during construction, either into control stations or further afield. The progression into mine operation activities and the decrease in intensive disturbances appears to have allowed these species to re-disperse evenly and for some, to move into optimal regenerating habitats created by the construction activities. Other species do not appear to have been adversely affected by construction activities but are showing preferential locations in post construction.

Mine related construction activities may provide increased habitat opportunities for some songbirds in the areas surrounding the RRM footprint. Species of Conservation Concern (SCC) Edge / Shrub / Successional birds increased specifically at impact stations. This indicates that construction activities have resulted in the creation of early successional habitat preferred by these species, causing a shift into these optimal habitats. Two species within this guild analysis, Chestnut-sided Warbler and Song Sparrow showed similar significant trends at the species level.

Forest birds (SCC and non-SCC) showed interaction effects whereby abundance and richness decreased at impact stations between 2014/15 and 2016, followed by an increase in these metrics in 2018 (i.e., post-construction). Conversely, these metrics increased at control station between 2014/15 and 2016, followed by a decrease in 2018. This indicates that these species may have been negatively impacted by construction activities being undertaken at the RRM impact stations. Individuals may have avoided impact

stations in 2016 and established breeding territories further away from construction activities. Individuals appear to be dispersing more evenly in 2018 (post-construction) now that habitats around impact stations are no longer undergoing active disturbance. Forest birds are frequently more common at control stations as compared to impact stations suggesting that there is more optimal (forested) habitat for these species further from the RRM. Black-and-white Warbler, Hermit Thrush, Red-eyed Vireo and White-throated Sparrow, species belonging to the Forest bird guild, showed similar results at the species level.

Grassland / Open Country birds are showing broad population increases, which could be attributed, at least in part, to the prevalence of optimal habitat provided by the Bobolink Overall Benefit lands and the work undertaken by New Gold to ensure these lands are maintained as high quality grassland bird habitat. Non-SCC Grassland birds had greater density and richness at impact stations. However, this may be a result of study design bias, since 32 stations were located within the Bobolink Overall Benefit areas (which provide preferred grassland habitat), as opposed to 11 control stations.

Overall, the data suggests that at this time most birds are not avoiding areas associated with mine activities, other than where habitats have been directly displaced by mine infrastructure. Abundance and density values which decreased in 2016 appear to be trending back towards baseline values, suggesting a lack of residual negative interaction effects on species and guilds. Ongoing monitoring studies will continue to identify longer term trends in avoidance and / or acclimatization of bird species to RRM activities.

1.0 Introduction

1.1 Project Background

New Gold Inc. (New Gold) is constructing, operating and eventually reclaiming a new open pit and underground gold mine, the Rainy River Mine (RRM). The RRM will produce doré bars (gold with silver) for sale. Physical works related to the RRM consists primarily of:

- Open pit and underground mine;
- Overburden, mine rock and low grade ore stockpiles;
- Primary crusher and process plant;
- Tailings management area;
- 230 kilovolt transmission line;
- Relocation of a portion of gravel-surfaced Highway 600; and
- Associated buildings, facilities and infrastructure.

The RRM site is located in the Township of Chapple, District of Rainy River, in northwestern Ontario, approximately 65 kilometres (km) northwest of Fort Frances, and 420 km west of Thunder Bay (Figure 1-1). Lands in the immediate RRM site vicinity are typically gently rolling to flat, forested wetlands in low-lying areas, rounded bedrock outcrops and subcrops in upland areas and areas that have been cleared for agriculture. Local drainage systems are characterized by small creeks that flow to the Pinewood River which drains most of the RRM site area.

Environmental baseline studies for the RRM, initiated in 2009 and continued through development, established a comprehensive understanding of the composition of local plant and wildlife communities within the RRM footprint as well as surrounding lands. Regular baseline reports and wildlife monitoring reports have been produced in addition to annual Species at Risk (SAR) assessments (KCB 2011; AMEC 2011, 2012, 2014, 2015; Amec Foster Wheeler 2016a). The assessment of potential environmental impacts of the RRM was summarized in the RRP Final Environmental Assessment (EA) Report (Environmental Impact Statement) Version 2 (AMEC 2014), submitted to the Federal and Provincial Governments, including for Aboriginal and public review. A positive Federal EA Decision Statement was issued on January 12, 2015, and a favourable Provincial EA Notice of Approval was released on January 29, 2015. Construction of the RRM began in the winter of 2015, and normal operations and production began in 2017.

As a component of the Federal EA process, Wood Environment & Infrastructure Solutions, a Division of Wood Canada Limited (Wood; formerly Amec Foster Wheeler Environment & Infrastructure), was retained to create and implement a Follow-up Monitoring Plan (FMP; Amec Foster Wheeler 2016b). In accordance with the *Canadian Environmental Assessment Act, 2012* (CEAA 2012), the purpose of the FMP is to verify the accuracy of the predictions made in the EA about the potential impacts of the RRM on wildlife and wildlife habitat, and to monitor the effectiveness of rehabilitation efforts for wildlife habitat and terrestrial environments.

1.2 Objective and Scope

The RRP Final EA Report (AMEC 2014) estimated that approximately 2,170 hectares (ha) of terrestrial habitat would be directly impacted by the RRM. A total of 1,352 ha of woodland habitat would be cleared, of which 1,090 ha comprised second-growth aspen-birch hardwood forest, the dominant forest community type in the natural environment local study area (NLSA, as defined in AMEC 2014; Figure 1-2). Other affected community types include active agricultural lands (277 ha), open wetland habitat (261 ha), coniferous swamp (16.5 ha), and cultural meadows / fallow fields (10.8 ha). Portions of an additional 27 boreal community types were to be removed, with 11 of these community types expected to experience a loss of less than 10 ha. The NLSA supports a variety of wildlife species, including breeding populations of SAR and provincially rare species (AMEC 2014). The principal mitigation measures designed to limit adverse effects to terrestrial systems for the RRM include the development of a compact project footprint and the avoidance of SAR territories.

This *2018 Wildlife Monitoring Report* has been created to support the objectives of the FMP. The report presents the results of wildlife monitoring surveys undertaken in 2018 by Wood. Detailed monitoring results for SAR, including evening crepuscular bird surveys, are presented under a separate title, *2018 Species at Risk Monitoring Report* (Wood 2018).

RAINY RIVER MINE

Local and Regional Natural Study Areas

PROJECT N°: TC111504 | **FIGURE: 1-2**

SCALE: 1:150,000 | DATE: February 2019

2.0 Methodology

The following subsections outline the field methodology for completing the wildlife monitoring program, as well as the study design and analytical approach undertaken to evaluate project-related effects on avian communities.

The RRM FMP for breeding migratory birds and their habitats follows the Environment Canada (EC) guidelines for surveys as outlined in *Mining Project Baseline Desktop Assessment and Survey Requirements* (EC 2014a), *Incidental Take of Migratory Birds in Canada* (EC 2014b), and *General Nesting Periods of Migratory Birds in Canada* (EC 2018).

2.1 Avian Community

2.1.1 Morning Point Count Surveys

During the 2018 breeding bird season, morning point count surveys were undertaken at 185 long-term monitoring point count stations (Figure 2-1) distributed across available habitat types. All of these same point count stations were previously surveyed in 2016; however, only 181 of the 185 stations were surveyed in either 2014, 2015, or both. As such, statistical analyses on the temporal and/or spatial changes in the distribution, abundance, density and richness of avian species were only completed on the 181 stations surveyed across all monitoring years. High-level comparisons in avian community data between 2016 and 2018 were, however, evaluated using all 185 stations.

Magnolia Warbler (Photo: Wikimedia Commons)

Point count surveys were undertaken in accordance with standardized protocols (Fuller and Langslow 1994; OBBA 2001; EC 2014a) and were designed to target the majority of bird species that breed in proximity to the RRM site. The 2018 surveys were undertaken twice at each station during the breeding bird season by qualified biologists skilled in the identification of birds by sight and sound. During the second round of sampling, stations were surveyed in the reverse order from the first round (to the greatest extent possible) to reduce temporal sampling bias. Surveys were initiated prior to sunrise and extended to five hours after sunrise, depending on the weather conditions. Point count surveys were aborted or postponed if weather conditions were not optimal (e.g., light rain or high wind above 20 km/hour). Surveys were conducted for ten minutes at each listening station (an increase from the five minute listening period outlined in the OBBA 2001 guidelines) and all birds heard or observed were recorded at intervals of 0 to 50 metres (m), 50 to 100 m, > 100 m, and flyovers. In addition, birds were recorded at intervals of 0 to 3 minutes, 3 to 5 minutes, and 5 to 10 minutes. Each bird was recorded once and mapped on the field data sheets to minimize duplication of individual birds, as best feasible.

The first round of surveys was conducted between May 30 and June 5, 2018 and the second round of surveys was conducted between June 21 and 27, 2018. Incidental sightings were documented, particularly for SAR and species not detected during standardized point count surveys.

2.1.2 Analytical Methods

Morning point count survey stations are separated into impact and control stations. Impact stations were selected from point count stations surveyed at least once during the 2009 to 2014 baseline breeding bird studies and are located around the periphery of the RRM site (Figure 2-1), and in areas where noise from mine operation is expected to be greater than the average ambient noise level (approximately 40 decibels; dBA). Control stations are located at least 5 km from the RRM site (Figure 2-1), chosen to reflect a similar representation of ecosites found at impact stations, and where noise from mine operation is expected to be at or below the average ambient noise level. Additionally, the impact stations were positioned along the transmission line right-of-way (ROW), with control stations located at least 1 km from the ROW (Figure 2-1). Given the extent of previous anthropogenic disturbances and associated road networks throughout the area, it is recognized that birds at these control locations are likely experiencing and / or have experienced minor disturbance. As such these control stations serve as a reference with which to measure the effects of mine-related activities.

The purpose of separating stations into impact and control types was to allow for the application of a Before-After Control-Impact (BACI) study design, used to evaluate potential project-related effects on avian populations. The BACI design is statistically powerful, defensible, and allows for comparisons of the population metrics across years and between station types. The initial surveys were completed at 181 point count stations in 2014 and 2015, prior to the initiation of construction activities in the winter of 2015. These stations were re-surveyed over the years to allow for direct comparisons of the metrics during and after construction with baseline values. The paired nature of the design allows for an assessment of the potential adverse effects by the RRM on the avian population before and after construction activities.

The RRM FMP for breeding migratory birds and their habitats follows the EC guidelines for surveys as outlined in EC 2014a. As per this guideline, several metrics were applied to compare yearly changes in avian populations in an evaluation of potential project-related effects. The data and results are presented separately for impact and control stations. These metrics include:

- *Species Distribution (Percent Occurrence) Among Survey Stations:* a measure of the occurrence of individual species of birds at each point count station expressed as the percent occurrence. Percent occurrence was calculated by dividing the total number of species recorded by the total number of point count stations surveyed. This index of species prevalence does not take into account observation distance.

- *Species Abundance:* a measure of the maximum number of individuals recorded across all visits to a single point count station regardless of distance. The mean species abundance was calculated by dividing the sum of the maximum number of individuals recorded across all visits by the total number of point count stations. Species abundance is expressed as birds per station (birds/station).

- *Species Density*: a measure of the number of individual species present per unit area. Density was calculated at each survey station as the maximum number of birds per species recorded within a 100 m radius of the surveyor divided by the total area of the survey station (3.1416 ha), divided by the total number of count stations. Species density is expressed as birds per hectare (birds/ha).

- *Species Richness:* a measure of the total maximum number of species recorded across all visits to a single point count station regardless of distance. The mean species richness was calculated by

dividing the sum of the maximum number of species recorded across all visits by the total number of count stations. Species richness is expressed as species per station (species/station).

The Ontario Landbird Conservation Plan has been created by Partners in Flight (PIF), through the collaboration of the Ontario Ministry of Natural Resources and Forestry (MNRF), Bird Studies Canada (BSC), and EC. In Ontario, plans have been developed for each of the three Bird Conservation Regions (BCR) occurring within the province. The purpose of these plans is to guide landbird conservation efforts so that the distribution, diversity and abundance of birds across this region are sustained within the estimated range of natural variability for this forest ecosystem. The Ontario Landbird Conservation Plan for the Boreal Hardwood Transition (North American BCR 12) overlaps with the NLSA (PIF 2008; EC 2014c).

For the purposes of this report, Species of Conservation Concern (SCC) include BCR 12 priority species as well as provincially and federally-listed SAR (PIF 2008, EC 2014c, ECCC 2018, MNRF 2018). The population metrics have been evaluated and results presented separately for SCC and non-SCC. This was done to highlight results for those species for which conservation has been prioritized.

For some analyses, bird species recorded were also grouped into one of four guilds based on habitat preferences. These four categories include:

- Edge / shrub / successional (species typical of shrubby and/or young habitats, including shrub swamps, bogs and fens);
- Forest (species typical of treed habitats, including treed swamp);
- Wetland / open water (species typical of large rivers, lakes and marshes); and
- Grassland / open country (species typical of open habitats).

Occasionally, observations were excluded from certain analyses. Observations of large flocks or groups of a single species can result in outliers in the statistical analyses and were consequently removed. Notations are made in each relevant results section when observations were excluded.

2.1.3 Statistical Analysis

Statistical analyses were completed using STATISTICA© software (StatSoft, Inc., 2009). A repeated measure analysis of variance (ANOVA) was applied to evaluate project-related effects on avian population metrics. Statistical analyses were completed on only those point count stations where monitoring was completed pre-construction (2014 or 2015), during construction (2016), and post-construction (2018). For pre-construction data, 2014 data was only included in the analysis when no 2015 data existed for a given point count station. Monitoring years (2014/15, 2016 and 2018) were inputted as the repeated dependent variables and station type (impact versus control station) was inputted as the categorical predictor. Assumptions of normality (normal distribution) were tested using Kolmogorov-Smirnov test and Shapiro-Wilk's test, as well as visually assessing quantile-quantile (Q-Q) plots and histograms. Some minor deviations from normality were detected within the analyses depending on the normality test applied; however, a graphical assessment of histograms and Q-Q plots suggested deviations were minor. Sphericity analysis, a measure of variance between all possible pairs of within-subject conditions, was also completed to verify the assumptions of repeated measures ANOVA; however, the assumption of sphericity was violated for several analyses. Nonetheless, as paired parametric analyses are highly robust to the presence of small deviations from normality and preferred over non-parametric analyses, the small

deviations were considered acceptable to allow for the application of the parametric repeated measures ANOVA. Where sphericity was violated, a discussion on the influence of the violation relative to the analysis is provided in the results section below. Where the analyses revealed a significant interaction (i.e., one of the variables differs depending on the level of the other variable), the Fisher's Least Significant Difference (LSD) post-hoc test was utilized to detect differences between groups.

As the consequences of making Type II errors (false negative) may outweigh those associated with Type I errors (false positive) when evaluating environmental effects, a significance level of 0.10 (alpha = 0.10) was used to detect significant differences rather than 0.05 (Steidl et al. 1997).

2.2 Other Taxa

Incidental observations of other taxa, including mammal, reptile and amphibian species were collected opportunistically concurrently with the targeted avian surveys within the NLSA. The incidental observations included, but were not limited to: visual observations, vocalizations, and evidence such as tracks, scat, burrows and nests.

RAINY RIVER MINE

2018 Breeding Bird Point Count Survey Station Locations

PROJECT N°: TC111504	**FIGURE: 2-1**
SCALE: 1:125,000	DATE: February 2019

3.0 Results

The purpose of the RRM FMP is to evaluate potential project-related impacts on avian species in proximity to the RRM operations. Accordingly, this 2018 Wildlife Monitoring Report presents 2018 field results, high-level comparisons of the current results with those gathered at the same survey stations in 2016 (n=185), and a BACI statistical analysis to compare the current results with those gathered at the same survey stations in 2014/15 and 2016 (n=181).

Results for SAR listed as Threatened or Endangered under the *Endangered Species Act, 2007*, including Evening Crepuscular Bird Survey results are presented in the *2018 RRP Species at Risk Report* (Wood 2018) as required by Provincial and Federal legislation. As such, SAR are included in the following analyses but are not highlighted other than by grouping them with other SCC.

3.1 Avian Community

A total of 164 bird species have been recorded within the RRM monitoring area between 2009 and 2018, however, the number of bird species recorded has varied with each monitoring year. In 2018, 132 bird species and 4,309 individual birds were recorded during the morning point count surveys, which is an increase from the 115 species and 3,890 individual birds recorded in 2016 at the same 185 point count stations. A summary of all species recorded within each survey year (during standardized counts and incidentally) is provided in Appendix A.

3.1.1 Species of Conservation Concern

Morning point count surveys undertaken in 2018 recorded a total of 54 avian SCC, accounting for 40.9% of the total bird species recorded in 2018 (Appendix B). Forty-five (45) SCC were recorded at impact stations and 48 were recorded at control stations. These data indicate that there is currently little to no difference between the number of avian SCC at impact and control stations. The 54 species are all considered BCR 12 priority species with 12 further designated as SAR. Avian SAR are discussed further in the *2018 RRP Species at Risk Report* (Wood 2018).

Two SCC recorded in 2016 were not recorded during morning surveys in 2018 (Red Crossbill and Red-headed Woodpecker; Appendix C), whereas ten SCC recorded in 2018 had not been recorded in 2016 (American Woodcock, Black-throated Blue Warbler, Cliff Swallow, Evening Grosbeak, Herring Gull, Hooded Merganser, Northern Rough-winged Swallow, Purple Finch, Ring-necked Duck and Vesper Sparrow). Two additional SCC, Common Nighthawk and Eastern Whip-poor-will, were both frequently recorded during crepuscular surveys; one Common Nighthawk was recorded during morning surveys in 2016, and one Eastern Whip-poor-will was recorded during 2018 morning surveys but were otherwise not detected during morning point count surveys.

Barn Swallow (Photo: ThinkStock)

3.1.2 Species Distribution among Survey Stations

Of the 132 bird species identified within the monitoring area during the 2018 morning point count surveys, 113 species were recorded at impact stations and 120 species were recorded at control stations. Despite the slightly greater occurrence of species at control stations, the most widely occurring species were largely comparable.

Species of Conservation Concern

The five most widely occurring SCC recorded at impact stations in 2018, including the percentage of stations where presence was observed, were:

- Nashville Warbler (recorded at 73.3% of all impact stations);
- Common Yellowthroat (67.8%);
- Chestnut-sided Warbler (62.2%);
- White-throated Sparrow (54.4); and
- Song Sparrow (53.3).

Nashville Warbler (Photo: Bill Majoros/Wikimedia Commons)

These species were also the five most widely occurring SCC recorded at impact stations in 2016. The summary of dominant SCC occurrence between 2016 and 2018 is provided in Table 3-1 and presented in Illustration 1. Percent occurrence for all species from the 2018 surveys is presented in Appendix B and a multi-year comparison of population metrics is presented in Appendix C.

Four of these five species were also amongst the five most widely occurring species across the control stations. The five most widely occurring SCC recorded at control stations in 2018, including the percentage of stations where presence was observed, were:

- Nashville Warbler (81.1%);
- White-throated Sparrow (63.2%);
- Veery (46.3%);
- Chestnut-sided Warbler (43.2%); and
- Common Yellowthroat (34.7%).

Similar to the impact stations, these species were also the five most widely occurring SCC recorded at control stations in 2016. These results indicate that there is little difference in the dominant SCC species between the impact and control stations, as well as between survey years.

Non-Species of Conservation Concern

The five most widely occurring non-SCC recorded at impact stations in 2018, including the percentage of stations where presence was observed, were:

- Red-eyed Vireo (80.0%);
- Ovenbird (67.8%);
- American Robin (62.2%);
- Black-and-white Warbler (52.2%); and
- Blue Jay (42.2%).

These species were also the five most widely occurring non-SCC recorded at impact stations in 2016.

Four of these five species were also amongst the five most widely occurring species across the control stations. The six most widely occurring non-SCC recorded at control stations in 2018, including the percentage of stations where presence was observed, were:

- Red-eyed Vireo (91.6%);
- Ovenbird (70.5%);
- Black-and-white Warbler (50.5%);
- American Robin (48.4%);
- Hermit Thrush (41.1%); and
- Blue Jay (37.9%).

Red-eyed Vireo (Photo: Wikimedia Commons)

These species were also the six most widely occurring non-SCC recorded at control stations in 2016. These results indicate that there is little difference in the dominant non-SCC species between the impact and control stations, as well as between survey years.

The summary of dominant non-SCC occurrence is provided in Table 3-1 and presented in Illustration 2. Percent occurrence for all species from the 2018 surveys is presented in Appendix B and a multi-year comparison of population metrics is presented in Appendix C.

The slight differences within these species lists between impact and control stations indicate that impact stations may be attracting more species which adapt well to anthropogenic disturbances and prefer shrubby, regenerating and edge habitats (Song Sparrow and higher percent occurrence of Common Yellowthroat, Chestnut-sided Warbler and American Robin) while the control stations are attracting species which prefer forested habitats (Veery, Hermit Thrush and higher percent occurrence of Nashville Warbler, White-throated Sparrow, Red-eyed Vireo and Ovenbird).

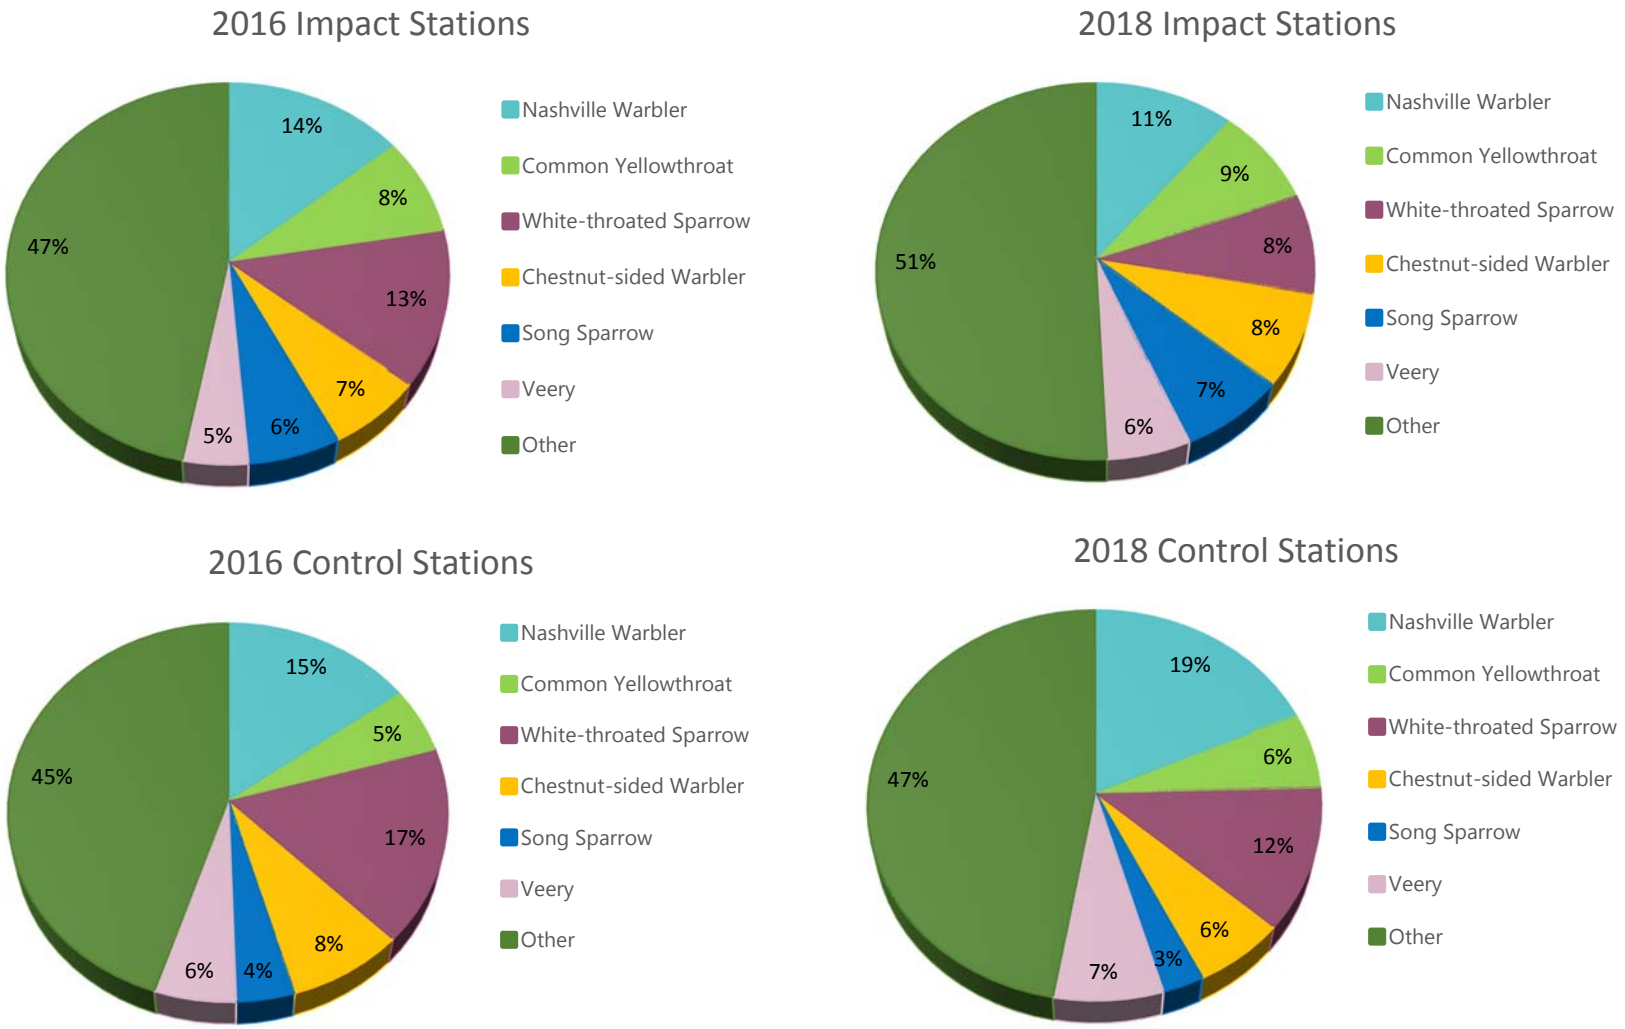

Illustration 1: Abundance of Dominant SCC Birds

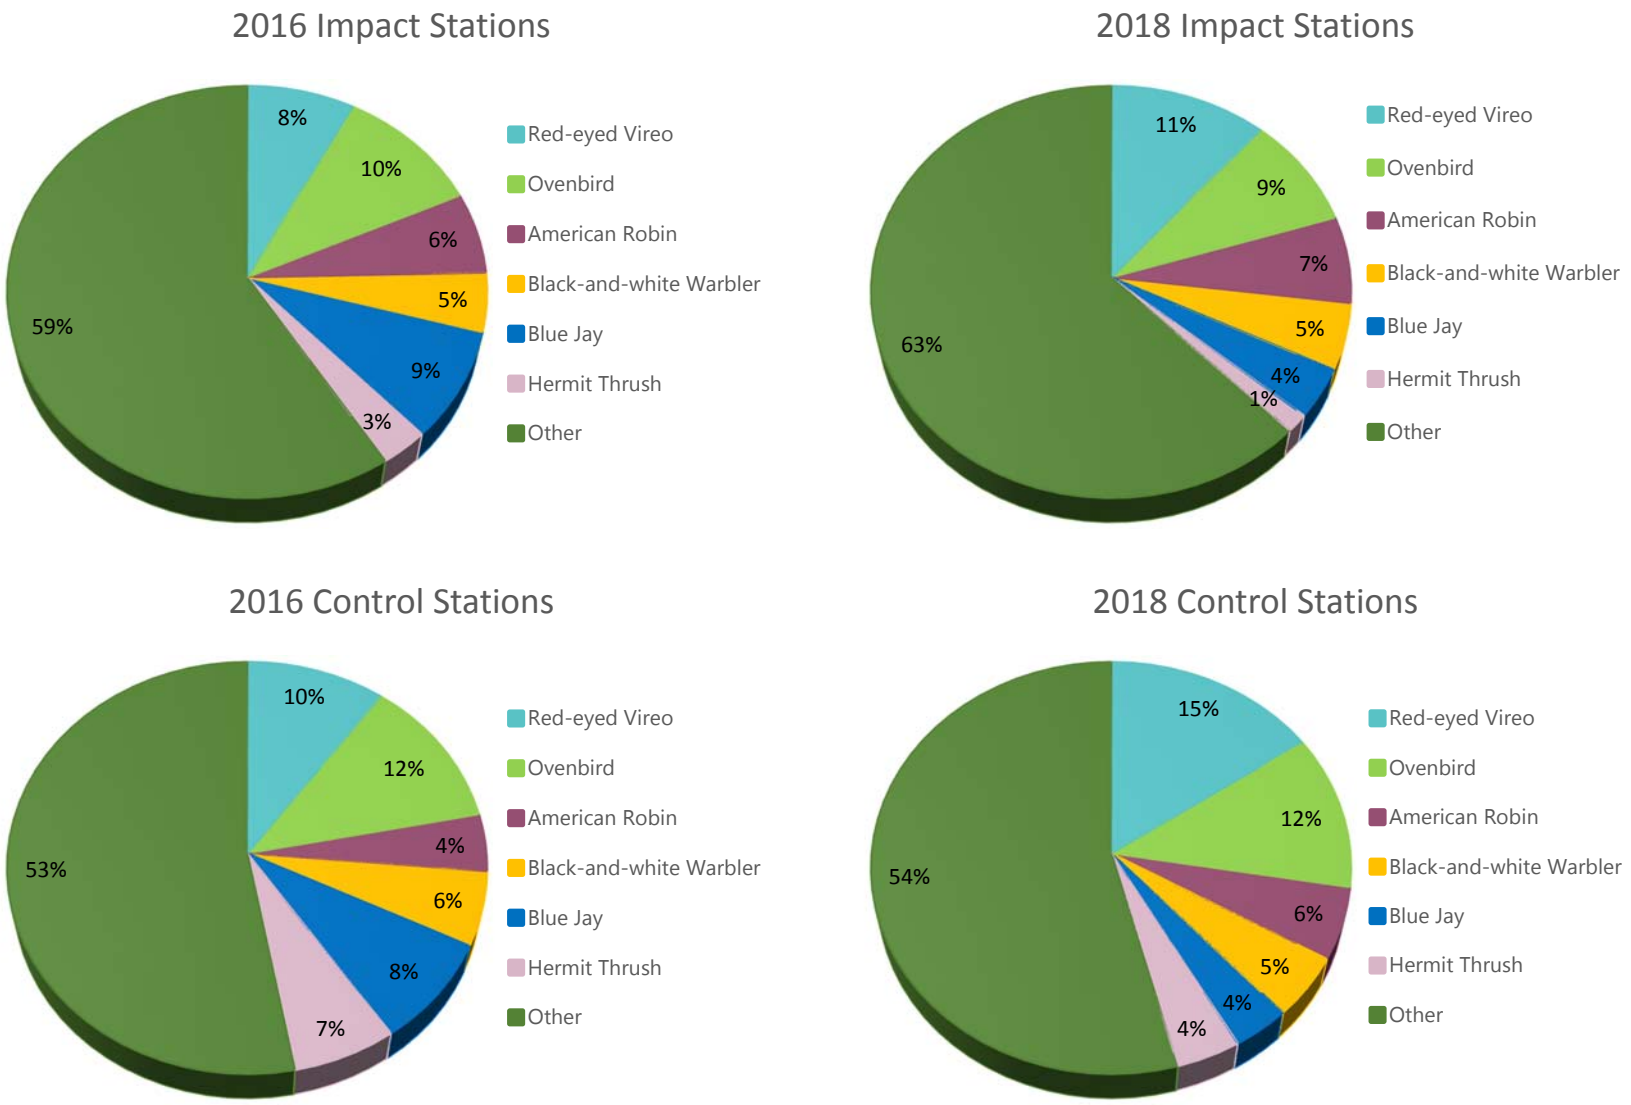

Illustration 2: Abundance of Dominant non-SCC Birds

3.1.3 Species Abundance

3.1.3.1 2018 Results

The most abundant birds were considered to be those with the highest abundance coupled with a relatively high (>25%) percent occurrence. Several species were identified in flocks or large groups and these bulk observations were excluded from the lists of dominant species and analyses as they can represent outliers in the statistical analyses.

During the 2018 morning point count surveys, 2,197 individual birds were recorded at impact stations and 2,112 individual birds were recorded at control stations. Despite the slightly greater abundance of individual birds at impact stations, the lists of most abundant species were largely comparable.

The five most abundant SCC recorded at impact stations in 2018, including their mean abundance, were:

- Nashville Warbler (average 1.28 birds/point count station across all impact stations);
- Common Yellowthroat (1.00 birds/point count station);
- White-throated Sparrow (0.99 birds/point count station);
- Chestnut-sided Warbler (0.94 birds/point count station); and
- Bobolink (0.89 birds/point count station).

These species were also the five most abundant SCC recorded at impact stations in 2016. Abundances for all species from the 2018 surveys are presented in Appendix B and a multi-year comparison of population metrics is presented in Appendix C.

Four of these five species were also amongst the five most abundant SCC across the control stations. Consequently, the five most abundant SCC recorded at control stations in 2018, including their mean abundance, were:

- Nashville Warbler (1.66 birds/point count station);
- White-throated Sparrow (1.07 birds/point count station);
- Veery (0.66 birds/point count station);
- Common Yellowthroat (0.57 birds/point count station); and
- Chestnut-sided Warbler (0.57 birds/point count station).

Common Yellowthroat (Photo: Matt Tillett/Wikimedia Commons)

These species were also the five most abundant SCC recorded at control stations in 2016.

Canada Goose was excluded from this 2018 list of SCC at control stations. While this species had an abundance value of 0.86 birds/point count station, it was observed at only four point count stations. In one instance a flock of 65 individuals was recorded flying over a single survey station.

The five most abundant non-SCC recorded at impact stations in 2018, including their mean abundance, were:

- Red-eyed Vireo (1.41 birds/point count station);
- Ovenbird (1.10 birds/point count station);
- Savannah Sparrow (0.88 birds/point count station);
- American Robin (0.84 birds/point count station); and
- Black-and-white Warbler (0.64 birds/point count station).

Four of these five species were also the most abundant non-SCC recorded at impact stations in 2016. In 2016, Blue Jay was one of the most abundant non-SCC at impact stations in 2016, replacing Black-and-white Warbler in the list above.

Four of these five species were also amongst the five most abundant species across the control stations. The five most abundant non-SCC recorded at control stations in 2018, including their mean abundance, were:

- Red-eyed Vireo (1.84 birds/point count station);
- Ovenbird (1.44 birds/point count station);
- American Robin (0.67 birds/point count station);
- Black-and-white Warbler (0.58 birds/point count station); and
- Hermit Thrush (0.48 birds/point count station).

Four of these five species were also the most abundant non-SCC recorded at control stations in 2016. In 2016, Blue Jay was one of the most abundant non-SCC recorded at control stations, replacing American Robin in the list above.

There is substantial overlap between the most abundant species and the most widely distributed species. Further statistical analyses were conducted on the abundances of the most widely occurring SCC and non-SCC recorded in 2018 (as described in Section 3.1.2). Summaries of these analyses are provided in Table 3-2 and Table 3-3.

3.1.3.2 BACI Analysis Results

The BACI analysis revealed no significant interaction effect between station type (impact or control) and year relative to the abundance of some of the most widely occurring SCC (Nashville Warbler, Common Yellowthroat and Veery), and some of the most widely occurring non-SCC (Red-eyed Vireo, Ovenbird, American Robin and Blue Jay), suggesting that RRM construction

Hermit Thrush (Photo: Matt MacGillivray/Wikimedia Commons)

and operations have not adversely affected the abundance of these species since baseline conditions (2014/15; Table 3-2 and Table 3-3).

However, this trend was not universal among the SCC and non-SCC birds evaluated. Analysis of SCC Chestnut-sided Warbler ($F_{2,266}$ = 10.2023, $p < 0.0001$), Song Sparrow ($F_{2,196}$ = 5.9626, $p = 0.0031$), White-throated Sparrow ($F_{2,340}$ = 2.5024, $p = 0.0834$), and non-SCC Black-and-white Warbler ($F_{2,282}$ = 2.8318, $p = 0.0606$) and Hermit Thrush ($F_{2,232}$ = 2.6775, $p = 0.0709$) showed significant interaction effects indicating that abundance at control and impact stations differs depending on the year.

Further analysis revealed that the abundance of Chestnut-sided Warbler significantly increased at impact stations between 2014/15 and 2016, and again between 2016 and 2018 ($p = 0.0035$ and $p = 0.0154$, respectively). Abundance of this species significantly increased at control stations between 2014/15 and 2016 ($p = 0.0234$), and then significantly decreased between 2016 and 2018 ($p = 0.0051$). Chestnut-sided Warbler abundance was significantly greater at control stations compared to impact stations in 2014/15 and 2016 ($p = 0.0083$ and $p = 0.0279$). However, in 2018 this pattern was reversed with abundance significantly greater at impact stations ($p = 0.0100$). The significant increases in population at both control and impact stations in 2016 may indicate this species is experiencing broad population increases across the overall monitoring area which did not appear to be adversely impacted by the construction activities being undertaken at the RRM impact stations. The continued increase in abundance at impact stations in 2018 and the concurrent drop in abundance at control stations may indicate that the construction activities have resulted in disturbed areas which have begun regenerating into preferred successional habitat for this species causing a shift into these new optimal habitats. The assumption of sphericity was violated for the Chestnut-sided Warbler abundance analysis ($p = 0.0497$) resulting in an increased chance of Type I error, as such results should be interpreted with some caution. In this instance there is a clear trend in the mean abundances with non-overlapping standard errors and relatively low p-values (not approaching the limit of 0.10), therefore, it is likely that these assertions are significant despite the violation of sphericity.

Further evaluation of Song Sparrow revealed a decrease in abundance at impact stations between 2014/15 and 2016 (not significant; $p = 0.2057$) before significantly increasing between 2016 and 2018 ($p = 0.0522$). Concurrently, abundance of this species decreased significantly at control stations between 2014/15 and 2016 ($p = 0.0521$), and again between 2016 and 2018 ($p = 0.0888$). This resulted in Song Sparrow abundance being significantly greater at impact stations compared to control stations in 2018 ($p = 0.0017$), a difference that was not significant in the previous monitoring years. The decreases between 2014/15 and 2016 at both the control and impact stations indicate broad population declines across the overall monitoring and did not appear to be further impacted by the construction activities being undertaken at the RRM. The increase in population abundance at impact stations in 2018 and concurrent drop in abundance at control stations may indicate that the construction activities have resulted in the creation of early successional habitat, preferred by Song Sparrow, in the disturbed areas which and that the birds are shifting into these optimal habitats.

Further analysis revealed the abundance of SCC White-throated Sparrow significantly decreased at impact stations between 2014/15 and 2016 ($p = 0.0932$), and again between 2016 and 2018 ($p = 0.0045$). Abundance at control stations showed an increase between 2014/15 and 2016 (not significant; $p = 0.1443$), followed by a significant decrease between 2016 and 2018 ($p < 0.0001$). The overall abundances for this species in 2014/15 and 2016 were similar, suggesting that the significant decrease in abundance at impact stations and the (non-significant) increase at control stations is potentially due to individuals avoiding impact stations in 2016 and breeding further away from construction activities.

White-throated Sparrow abundance in 2018 was similar between impact and control stations, potentially due to individuals dispersing more evenly post-construction once habitats around impact stations were no longer undergoing active disturbance. There also appears to be a broad population decrease in 2018 across the overall monitoring areas, demonstrated by the significant decreases at both impact and control stations.

Further evaluation of Black-and-white Warbler revealed a significant increase in abundance at control stations between 2014/15 and 2016 ($p = 0.0057$) and remained significantly higher in 2018 than it was in 2014/15 ($p = 0.0773$). In 2016, the control stations had significantly higher abundance of this species than impact stations ($p = 0.0253$). A subsequent significant increase in abundance of this species occurred at impact stations between 2016 and 2018 ($p = 0.0836$) and, as such, there was no longer a significant difference in Black-and-white Warbler abundance between impact and control stations in 2018. This could be explained by individuals choosing control stations further away from construction activities in 2016 and dispersing more evenly in post-construction once habitats around impact stations were no longer undergoing active disturbance.

Further analysis revealed the abundance of Hermit Thrush decreased at impact stations between 2014/15 and 2016 (not significant; $p = 0.1244$), followed by a significant decrease between 2016 and 2018 ($p = 0.0961$). Concurrently, the abundance at control stations increased between 2014/15 and 2016 (not significant; $p = 0.1989$), and then decreased significantly between 2016 and 2018 ($p = 0.0302$). This could be explained by population decreases across the overall monitoring area coupled with individuals preferentially using control stations in 2016, either to distance themselves from construction activities or due to preferred habitat loss. This utilization appears to be maintained in 2018 (post-construction) once the optimal forested habitats preferred by this species was removed near the impact stations. The assumption of sphericity was violated for the Hermit Thrush abundance analysis ($p = 0.0002$) resulting in an increased chance of Type I error, as such results should be interpreted with some caution. In this instance there is limited overlap of standard errors of the mean abundances and some of the p-values are relatively high, therefore, it is possible some of the significant interactions could be false positives. Regardless of significance, this is still a clear and notable trend despite the violation of sphericity, and the assertions and explanations are still valid.

The analysis of yearly effects (inclusive of impact and control stations) showed a significant increase in abundance of Veery ($F_{2,248} = 3.1774$, $p = 0.0434$), American Robin ($F_{2,298} = 3.0311$, $p = 0.0498$), and Red-eyed Vireo ($F_{2,348} = 30.0890$, $p < 0.0001$) in 2018 compared with the abundance in 2014/15 and 2016, indicating that these species may have experienced broad increases within the overall monitoring area between 2016 and 2018. All three of these species also experienced decreases in abundance between 2014/15 and 2016, although only the decrease in Red-eyed Vireo abundance was found to be significant. This indicates that these species may be experiencing broad population fluctuations between years within the overall monitoring area. Non-SCC Blue Jay ($F_{2,306} = 19.6596$, $p < 0.0001$) showed opposite effects, Blue Jay abundance significantly increased between 2014/15 and 2016 ($p < 0.0001$), followed by a significant decrease in abundance between 2016 and 2018 ($p < 0.0001$). This suggests that this species may be experiencing broad population fluctuations within the overall monitoring area. No yearly changes in abundance were observed for the other species analyzed (Table 3-3). The assumption of sphericity was violated for Blue Jay and Red-eyed Vireo abundance analyses ($p = 0.0057$ and $p = 0.0029$) resulting in an increased chance of Type I error, as such results should be interpreted with some caution. In the instance of both these species, there are clear trends in the mean abundances with non-overlapping standard errors and most p-values of < 0.0001, therefore, it is likely that these assertions are significant despite the violation of sphericity.

The analysis of location effects (inclusive of 2014/15, 2016 and 2018) showed Common Yellowthroat ($F_{1,125}$ = 2.8626, p = 0.0932) was significantly more abundant at impact stations compared to control stations indicating that habitat for these species was more prevalent within the impact areas. Conversely, Red-eyed Vireo ($F_{1,174}$ = 8.8833, p = 0.0033) and Ovenbird ($F_{1,155}$ = 5.0001, p = 0.0268) were significantly more abundant at control stations compared to impact stations indicating that habitat for these species was more prevalent within the control areas. No changes in abundance between impact and control stations were observed for the other species analyzed (Table 3-3). The assumption of sphericity was violated for the Common Yellowthroat abundance analysis (p = 0.0382) resulting in an increased chance of Type I error, as such results should be interpreted with some caution. In the instance of this species, there is no overlap of standard errors of the mean abundances however the p-value is relatively high, therefore, it is possible that this significant interaction could be a false positive. This is still a clear and notable trend despite the violation of sphericity and the explanations are still valid.

3.1.4 Species Density

3.1.4.1 2018 Results

The species with the highest densities were considered to be those with the highest density coupled with a relatively high (>25%) percent occurrence. Several species were identified in flocks or large groups and these bulk observations were excluded from the lists of dominant species and analyses as they represent outliers in the statistical analyses.

The five SCC recorded with the highest densities across all impact stations in 2018 were:

- Nashville Warbler (average 0. 350 birds/ha across all impact stations);
- Chestnut-sided Warbler (0.251 birds/ha);
- Common Yellowthroat (0.237 birds/ha);
- White-throated Sparrow (0.223 birds/ha); and
- Bobolink (0.209 birds/ha).

White-throated Sparrow (Photo: Pixabay)

These species were also the five SCC with the highest densities recorded at impact stations in 2016. Densities for all species from the 2018 surveys are presented in Appendix B and a multi-year comparison of population metrics is presented in Appendix C.

Four of these five species were also amongst the five SCC with the highest densities across the control stations. The five SCC with the highest densities at control stations were:

- Nashville Warbler (average 0.503 birds/ha across all control stations);
- White-throated Sparrow (0.251 birds/ha);
- Chestnut-sided Warbler (0.168 birds/ha);
- Common Yellowthroat (0.168 birds/ha); and

- Veery (0.121 birds/ha).

All five of these species were also the SCC with the highest densities recorded at control stations in 2016.

Barn Swallow was excluded from this 2018 list of SCC at control stations. While this species had a density value of 0.137 birds/ha, it was observed at only four point count stations.

The five non-SCC with the highest densities recorded at impact stations in 2018 were:

- Red-eyed Vireo (0.255 birds/ha);
- Savannah Sparrow (0.248 birds/ha);
- Ovenbird (0.202 birds/ha);
- LeConte's Sparrow (0.191 birds/ha); and
- Black-and-white Warbler (0.159 birds/ha).

Four of these five species also had the highest non-SCC densities recorded at impact stations in 2016. In the 2016 survey year, Blue Jay had the one of the highest densities of the non-SCC recorded at impact stations in 2016, replacing Black-and-white Warbler in the list above.

Three of these five species listed above were also amongst the five non-SCC with the highest densities across the control stations. The five non-SCC with the highest densities recorded at control stations in 2018 were:

- Red-eyed Vireo (0.456 birds/ha);
- Ovenbird (0.328 birds/ha);
- Black-and-white Warbler (0.171 birds/ha);
- American Robin (0.161 birds/ha); and
- Magnolia Warbler (0.134 birds/ha).

Three of these five species also had the highest non-SCC densities recorded at control stations in 2016. In the 2016 survey year, Golden-crowned Kinglet and Blue Jay had some of the highest densities recorded for non-SCC at the control stations, replacing American Robin and Magnolia Warbler in the list above.

Despite some differences, there is substantial overlap between the most abundant species and those with the highest densities. Further statistical analyses were conducted on the densities of the most widely occurring SCC and non-SCC recorded in 2018 (as described in Section 3.1.2). Summaries of these analyses are provided in Table 3-4 and Table 3-5.

3.1.4.2 BACI Analysis Results

The BACI analysis revealed no significant interaction effect between survey station type and year relative to the density of half of the most widely occurring SCC (Nashville Warbler, Common Yellowthroat and Veery), and half of the non-SCC (Ovenbird, American Robin and Blue Jay), suggesting that RRM construction and operations have not affected the densities of these species (Table 3-4 and Table 3-5).

American Robin (Photo: Ken Thomas/Wikimedia Commons)

However, this trend was not universal amongst the SCC and non-SCC birds evaluated. Analysis of SCC Chestnut-sided Warbler ($F_{2,266}$ = 7.9714, p = 0.0004), Song Sparrow ($F_{2,196}$ = 3.6906, p = 0.0267), White-throated Sparrow ($F_{2,340}$ = 3.9998, p = 0.0192), and non-SCC Red-eyed Vireo ($F_{2,348}$ = 3.8922, p = 0.0213), Black-and-white Warbler ($F_{2,282}$ = 2.7627, p = 0.0648) and Hermit Thrush ($F_{2,232}$ = 2.8269, p = 0.0612) showed significant interaction effects indicating that abundance at control and impact stations differs depending on the year.

Further analysis revealed the density of Chestnut-sided Warbler followed the same pattern as was seen for abundance. Density significantly increased at impact stations between 2014/15 and 2016 and again between 2016 and 2018 (p = 0.0176 and p = 0.0400). Density significantly increased at control stations between 2014/15 and 2016 (p = 0.0154) and significantly decreased between 2016 and 2018 (p = 0.0040). Chestnut-sided Warbler density was significantly greater at control stations compared to impact stations in 2014/15 and 2016 (p = 0.0137 and p = 0.0082). However, in 2018 this reversed with density significantly greater at impact stations (p = 0.0936). The significant increases in densities at both control and impact stations in 2016 indicate that this species is experiencing broad population increases across the overall monitoring area and did not appear to be adversely affected by the construction activities undertaken at the RRM impact stations. The continued increase in density at impact stations in 2018 and concurrent drop in density at control stations may indicate that the construction activities have created early successional habitat, preferred by Chestnut-sided Warbler, causing a shift into these optimal habitats. As with abundance, the assumption of sphericity was violated for the Chestnut-sided Warbler (p = 0.0329) resulting in an increased chance of Type I error, as such results should be interpreted with some caution. In this instance there are non-overlapping standard errors of the mean densities, all but one of the p-values are relatively low and there is a clear trend in the mean densities, therefore, it is likely that these assertions are significant despite the violation of sphericity.

Further evaluation of Song Sparrow revealed a similar pattern as was seen for abundance. Density significantly decreased (p = 0.0373) at impact stations between 2014/15 and 2016 before significantly increasing between 2016 and 2018 (p = 0.0111). Concurrently, density of this species decreased significantly between 2014/15 and 2016 (p = 0.0208) and continued to decrease slightly between 2016 and 2018 (not significant; p = 0.5608). Song Sparrow density was therefore significantly greater at impact stations compared to control stations in 2018 (p = 0.0216), a difference that was not significant in the previous monitoring years. The significant decreases between 2014/15 and 2016 at both control and impact stations could be due to broad population decreases across the overall monitoring area which did not appear to be adversely impacted further by the construction activities being undertaken at the RRM impact stations. The significant increase in density at impact stations in 2018 and concurrent non-significant decrease at control stations may indicate that the construction activities have resulted in the creation of early successional habitat, preferred by Song Sparrow, causing a shift into these optimal

habitats. The assumption of sphericity was violated for the Song Sparrow density analysis ($p = 0.0179$) resulting in an increased chance of Type I error, as such results should be interpreted with some caution. In this instance there is a clear trend in the mean densities with non-overlapping standard errors and relatively low p-values, therefore, it is likely that these assertions are significant despite the violation of sphericity.

Further analysis revealed that the density of White-throated Sparrow significantly decreased at impact stations between 2014/15 and 2016 ($p = 0.0035$) and increased at impact stations between 2016 and 2018 (not significant; $p = 0.2559$). The density at control stations showed an increase between 2014/15 and 2016 (not significant; $p = 0.3144$), followed by a decrease between 2016 and 2018 (not significant; $p = 0.2346$). White-throated Sparrow density was significantly greater at control stations than impact stations in 2016. Similar to the patterns observed for the abundance of this species, this is potentially due to individuals avoiding impact stations in 2016 and breeding further away from construction activities. Density in 2018 does not show a significant difference between impact and control stations, potentially due to individuals dispersing more evenly in 2018 post-construction once habitats around impact stations were no longer undergoing active disturbance. The assumption of sphericity was again violated for the White-throated Sparrow density analysis ($p = 0.0530$) resulting in an increased chance of Type I error, as such results should be interpreted with some caution. There is again a clear trend in the mean densities with non-overlapping standard errors and all the significant p-values are relatively low, therefore, it is likely that these assertions are significant despite the violation of sphericity.

Further evaluation of Red-eyed Vireo revealed a significant decrease in abundance between 2014/15 and 2016 at both the impact and control stations ($p = 0.0037$ and $p = 0.0954$). Subsequently, density significantly increased between 2016 and 2018 at both the impact and control stations ($p = 0.0026$ and $p < 0.0001$). Density was significantly greater at control stations than at impact stations in all monitoring years with the greatest difference in densities between the two station types in 2018. These results are likely in part due to broad population fluctuations across the overall monitoring area, combined with some avoidance of impact stations in 2016 due to increased construction activities. The increase in density at control stations in 2018 is likely because habitats around impact stations no longer support as much optimal (forested) habitat for this species. The assumption of sphericity was violated for the Red-eyed Vireo density analysis ($p = 0.0382$) resulting in an increased chance of Type I error, as such results should be interpreted with some caution. In the instance of this species, there is a clear trend in the mean densities with non-overlapping standard errors and most p-values are relatively low, therefore, it is likely that these assertions are significant despite the violation of sphericity and the assertions and explanations are valid regardless due to the clear trend in the data.

Further analysis revealed the density of Black-and-white Warbler once again followed the same pattern as was seen for abundance. Density significantly increased at control stations between 2014/15 and 2016 ($p = 0.0086$) and remained significantly higher in 2018 than it was in 2014/15 ($p = 0.0352$). As such, control stations in 2016 had significantly higher Black-and-white Warbler densities than impact stations ($p = 0.0503$). No significant changes in densities occurred between 2016 and 2018 at either the control or the impact stations. However, there was no significant difference in Black-and-white Warbler density between control and impact stations in 2018 ($p = 0.6040$). These results suggest that individuals may have preferentially used control stations further away from construction activities in 2016 and dispersed more evenly in post-construction once habitats around impact stations were no longer undergoing active disturbance.

Further analysis revealed the density of Hermit Thrush followed a similar pattern as was seen for abundance. Hermit Thrush density decreased significantly at impact stations between 2014/15 and 2016 ($p = 0.0323$), followed by a decrease in density between 2016 and 2018 (not significant; $p = 0.1863$). Concurrently, the density at control stations showed very minimal change across monitoring years. Hermit Thrush density was significantly greater ($p = 0.0556$) at control stations than impact stations in 2018. This suggests that individuals may have preferentially used control stations in 2016, either to distance themselves from construction activities or due to preferred habitat loss. This utilization appears to be maintained in 2018 (post-construction) with significantly greater density at control stations, potentially due the removal of optimal forested habitat, preferred by this species, near the impact stations. The assumption of sphericity was violated for the Hermit Thrush density analysis ($p < 0.0001$) resulting in an increased chance of Type I error, as such results should be interpreted with some caution. In this instance there is a clear trend in the mean densities with non-overlapping standard errors and the p-values are relatively low, therefore, it is likely that these assertions are significant despite the violation of sphericity.

The analysis of yearly effects (inclusive of impact and control stations) showed significant decreases in the density of Common Yellowthroat ($F_{2,250} = 5.2972$, $p = 0.0056$) between 2014/15 and 2016 ($p = 0.0041$), followed by a significant increase in the density of this species between 2016 and 2018 ($p = 0.0067$), indicating that this species may be experiencing broad population fluctuations within the overall monitoring area. No significant change in density was observed for Veery ($F_{2,248} = 3.8761$, $p = 0.0220$) and non-SCC Blue Jay ($F_{2,306} = 3.4179$, $p = 0.0340$) between 2014/15 and 2016. However, both species experienced significant changes in density between 2016 and 2018. Veery densities increased significantly ($p = 0.0131$) while Blue Jay densities decreased significantly ($p = 0.0220$). This suggests that these species may be experiencing broad increases and decreases (respectively) within the overall monitoring area. No yearly changes in density were observed for the other species analyzed (Table 3-5). The assumption of sphericity was violated for the Common Yellowthroat ($p = 0.0006$), Veery ($p = 0.0088$) and Blue Jay density analyses ($p = 0.0076$) resulting in increased chances of Type I error, as such results should be interpreted with some caution. In the instance of all three species, there are clear trends in the mean densities with non-overlapping standard errors and relatively low p-values, therefore, it is likely that these assertions are significant despite the violation of sphericity.

The analysis of location effects (inclusive of 2014/15, 2016 and 2018) showed Ovenbird ($F_{1,155} = 8.5917$, $p = 0.0039$) had a significantly greater density at control stations compared to impact stations suggesting that the less disturbed forest habitat preferred by this species, is more prevalent within the control areas. No changes in density between impact and control stations was observed for the other species analyzed (Table 3-5).

3.1.5 Species Abundance by Guild

Statistical comparisons of SCC and non-SCC by guild were conducted to detect significant differences in abundance between monitoring year (2014/15, 2016 and 2018) and survey station type (impact versus control) as summarized in Table 3-6 and Table 3-7. The total abundance of birds between monitoring years and station types was also evaluated, which was inclusive of all four guilds.

Several species were identified in flocks or large groups and these bulk observations were excluded from the guild analyses as they represent outliers in the statistical analyses. Within the abundance data, these species included: American White Pelican, Barn Swallow, Canada Goose, European Starling and Sharp-tailed Grouse.

Species of Conservation Concern

The SCC analysis revealed a significant interaction effect between survey station type and year relative to the abundance of the SCC Edge / Shrub / Successional birds ($F_{2,332}$ = 9.5154, p < 0.0001), Forest birds ($F_{2,358}$ = 4.6350, p = 0.0103), Grassland / Open Country birds ($F_{2,136}$ = 2.5805, p = 0.0794 and Total birds ($F_{2,358}$ = 7.1600, p = 0.0009) indicating that abundance at control and impact stations differs depending on the year.

Further analysis revealed the abundance of the SCC Edge / Shrub / Successional birds was relatively unchanged between 2014/15 and 2016. The abundance of birds in this guild significantly increased at impact stations between 2016 and 2018 (p = 0.0021), while decreasing significantly at control stations (p = 0.0358; Table 3-6 and Table 3-7). The abundance of SCC Edge / Shrub / Successional birds was also significantly greater at impact stations in 2018 (p < 0.0001) as compared to control stations. The lack of notable change in abundance at both impact and control stations between 2014/15 and 2016 indicates this guild of species was not adversely impacted by the construction activities being undertaken at the RRM impact stations. Additionally, the increase in population abundance at impact stations in 2018 and concurrent drop at control stations indicates that the construction activities have resulted in the creation of early successional habitat preferred by SCC Edge / Shrub / Successional birds, causing a shift into these optimal habitats. This result aligns with the similar species-level trends observed for Chestnut-sided Warbler and Song Sparrow, both of which are included in this habitat guild. The assumption of sphericity was violated for the SCC Edge / Shrub / Successional abundance analysis (p = 0.0975) resulting in an increased chance of Type I error, as such results should be interpreted with some caution. In this instance, there is a clear trend in the mean abundances with non-overlapping standard errors and relatively low p-values, therefore, it is likely that these assertions are significant despite the violation of sphericity.

Black-and-white Warbler (Photo: National Park Service)

Further analysis revealed the abundance of the SCC Forest birds to be similar at both impact and control stations in 2014/15. The abundance of these birds then significantly increased at control stations (p = 0.0200) between 2014/15 and 2016, while concurrently decreasing significantly at impact stations (p = 0.0610). As such, abundance was significantly greater at control stations than impact stations in 2016 (p < 0.0001). Between 2016 and 2018, the abundance of the SCC Forest birds significantly decreased (p = 0.0579) at control stations while showing increasing abundances at impact stations (not significant; p = 0.3311). Despite this, the significantly greater abundance of SCC Forest birds recorded at control stations as compared to impact was sustained in 2018 (p = 0.0858). These results indicate this guild may have been temporarily adversely affected by increased disturbance and habitat loss from the RRM construction activities. Disturbance typically experienced at impact stations may have included increased noise levels beyond tolerance thresholds and/or habitat degradation due to mine construction activities (e.g., road construction, tree removals) to a point where individuals of these species found alternative nesting territories at control stations in 2016. The subsequent decrease in abundance of SCC Forest birds at control stations, coupled with non-significant increase at impact stations in 2018 may indicate that effects from disturbances at these locations have decreased now that the RRM has entered the operations phase and these species are able to disperse more evenly. However, the continued significantly greater abundance at control stations indicates habitats around impact stations likely no longer support as much optimal (forested) habitat for these species.

Further evaluation of SCC Grassland / Open Country birds revealed a significant increase in abundance at both control and impact stations ($p = 0.0103$ and $p = 0.0571$) between 2016 and 2018. This appears to indicate a broad population increase across the overall monitoring area. This could be attributed to the work undertaken by New Gold to ensure protected Bobolink Overall Benefit lands are maintained as high quality grassland bird habitat or the clearing of previously woody vegetated land into anthropogenically open areas introducing new habitat for certain species. A non-significant decrease in abundance at impact stations between 2014/15 and 2016 may indicate these species were temporarily adversely affected by construction activities to a point where individuals of these species found alternative nesting territories. However, the subsequent increase in abundance at all stations in 2018 may indicate that disturbances at these locations have decreased now that the RRM has entered the operations phase and these species are able to again increase their utilization of habitats at these sites. The assumption of sphericity was violated for the SCC Grassland / Open Country abundance analysis ($p < 0.0001$) resulting in an increased chance of Type I error, as such results should be interpreted with some caution. In this instance there is a clear trend in the mean abundances and relatively low p-values, however, there is some overlap of the standard errors. Despite this the trends in the data are clear and notable it is likely that these assertions are significant despite the violation of sphericity.

Further analysis revealed total SCC bird abundance trends are similar to those observed in the two largest guilds showing interaction effects, SCC Edge / Shrub / Successional birds and SCC Forest birds. Total SCC abundance decreased (not significant; $p = 0.2918$) at impact stations between 2014/15 and 2016, followed by a significant increase ($p = 0.0010$) in abundance at impact stations between 2016 and 2018. Concurrently, Total SCC bird abundance significantly increased ($p = 0.0344$) at control stations between 2014/15 and 2016, followed by a significant decrease ($p = 0.0481$) between 2016 and 2018 (Table 3-6 and Table 3-7). These results support the theory that birds may have been temporarily adversely affected by construction activities to a point where individuals found alternative nesting territories (resulting in an increase in abundance at control stations), however, the subsequent increase in abundance at impact stations in 2018 corroborates the theory that disturbances at these locations have decreased now that the RRM has entered the operations phase and that new optimal habitat may have been created through these construction activities to support numerous species across the guilds.

The analysis for SCC revealed no significant interaction effects were observed for SCC Wetland / Open Water birds which would imply that the RRM construction and operations have not adversely affected the abundance of this guild. As well, the analysis of yearly effects (inclusive of impact and control stations) showed no changes in abundance between monitoring years for SCC Wetland / Open Water birds (Table 3-6 and Table 3-7).

The analysis of location effects (using pooled abundances for all years of study) showed that SCC Wetland / Open Water bird abundance was significantly greater at impact stations compared to control stations ($F_{1,134} = 5.2195$, $p = 0.0239$). This suggests that there may be more suitable habitats within the impact areas for these species. The assumption of sphericity was violated for the SCC Wetland / Open Water abundance analysis ($p < 0.0001$) resulting in an increased chance of Type I error, as such results should be interpreted with some caution. In this instance there is a clear trend in the mean abundances with non-overlapping standard errors and a low p-value, therefore, it is likely these assertions are significant despite the violation of sphericity.

Non-Species of Conservation Concern

The analysis for non-SCC revealed significant interaction effects between survey station type and year relative to the abundance of non-SCC Forest birds ($F_{2,358}$ = 3.7810, p = 0.0237) and Wetland / Open Water birds ($F_{2,198}$ = 2.7580, p = 0.0659) indicating that abundance at control and impact stations differs depending on the year.

Further evaluation of non-SCC Forest revealed a decrease in abundance at impact stations between 2014/15 and 2016 (not significant; p = 0.2790), followed by a significant increase in abundance between 2016 and 2018 (p = 0.0778). At control stations, non-SCC Forest bird abundance significantly increased between 2014/15 and 2016 (p = 0.0057) and demonstrated no notable change between 2016 and 2018. Abundance at control stations was significantly greater than at impact stations for all monitoring years with the largest differences in mean abundance occurring in 2016 followed by 2018. These results indicate this guild may have been temporarily adversely affected by increased disturbance and habitat loss from the RRM construction activities. Disturbance typically experienced at impact stations may have included increased noise levels beyond tolerance thresholds and/or habitat degradation due to mine construction activities (e.g., road construction, tree removals) to a point where individuals of these species found alternative nesting territories at control stations in 2016. The subsequent non-significant increase at impact stations in 2018 may indicate that disturbances at these locations have decreased now that the RRM has entered the operations phase and that these species are able to disperse more evenly. However, the continued significantly greater abundance at control stations indicates habitats around impact stations likely no longer support as much optimal (forested) habitat for these species.

Further analysis revealed the abundance of the non-SCC Wetland / Open Water birds increased at control stations between 2014/15 and 2016 (not significant; p = 0.2535), followed by a significant increase in the abundance of these birds between 2016 and 2018 (p = 0.0874). Abundance at impact stations showed no significant trend between years. In 2014/15, the abundance of non-SCC Wetland / Open water species was significantly greater at impact stations than at control stations (p = 0.0300). However, this trend was not found in 2016 and 2018. Instead, abundance was slightly greater (although not significantly) at control stations in 2018. These results suggest that these species were not adversely affected by the active construction in 2016. However, the current trends could indicate that habitat for these species was diminished at impact stations resulting in higher abundance of these species at control site post-construction in 2018. Further years of surveys will be needed to determine conclusive trends in abundance for these species.

The analysis of non-SCC guilds revealed no significant interaction effects between survey station type and year relative to the abundance of non-SCC Edge / Shrub / Successional birds, Grassland / Open Country birds or Total non-SCC birds. This would imply that the RRM construction and operations have not adversely affected the abundance of these guilds (Table 3-6 and Table 3-7). As well, the analysis of yearly effects (inclusive of impact and control stations) showed significant effects on the abundance of non-SCC Edge / Shrub / Successional birds ($F_{2,354}$ = 6.2746, p = 0.0021), Grassland / Open Country birds ($F_{2,122}$ = 13.2407, p < 0.0001) and Total non-SCC birds ($F_{2,358}$ = 10.4110, p < 0.0001).

Non-SCC Edge / Shrub / Successional bird abundance significantly decreased between 2014/15 and 2016 (p = 0.0624), followed by a significant increase in abundance between 2016 and 2018 (p = 0.0005), which indicates that these species are experiencing broad population fluctuations within the overall monitoring area. For non-SCC Grassland / Open Country birds, abundance significantly increased between 2014/15 and 2016 (p = 0.0002) and again between 2016 and 2018 (p = 0.0296), indicating that these species are

experiencing broad population increases within the overall monitoring area. The total combined non-SCC bird abundance also increased significantly between 2016 and 2018, which is mainly a result of the increase observed for non-SCC Edge / Shrub / Successional birds. The non-SCC Total birds showed an increase between 2014/15 and 2016 as well, although it was not significant. These results indicate that non-SCC birds overall are experiencing broad populations increases within the overall monitoring area. The assumption of sphericity was violated for the non-SCC Grassland / Open Country abundance analysis ($p = 0.0071$) resulting in an increased chance of Type I error, as such results should be interpreted with some caution. In this instance there is a clear trend in the mean abundances with minimal standard error overlap and relatively low p-values, therefore, it is likely that these assertions are significant despite the violation of sphericity.

The analysis of location effects (inclusive of 2014/15, 2016 and 2018) showed that non-SCC Edge / Shrub / Successional bird abundance was significantly greater at impact stations compared to control stations ($F_{1,177} = 5.1531$, $p = 0.0244$). This result is potentially due to a greater prevalence of suitable habitats within impact areas. Similarly, non-SCC Grassland / Open Country bird abundance was significantly greater at the impact stations compared to the control stations ($F_{1,61} = 12.8638$, $p = 0.0007$). This result is potentially due to the greater prevalence of impact stations located within Bobolink Overall Benefit lands (32 stations as opposed to 11 control stations) which provide suitable habitat.

3.1.6 Species Density by Guild

Statistical comparisons of SCC and non-SCC by guild were conducted to detect significant differences in density between monitoring year (2014/15, 2016 and 2018) and survey station type (impact versus control) as summarized in Table 3-8 and Table 3-9. The total density of birds between monitoring years and station types was also evaluated, which is inclusive of all four guilds.

Several species were identified in flocks or large groups and these bulk observations were excluded from the guild analyses as they represent outliers in the statistical analyses. Within the density data, these species included: Barn Swallow and Sharp-tailed Grouse.

Species of Conservation Concern

Similar to the results for abundance, the SCC analysis revealed a significant interaction effect between survey station type and year, relative to the density of the SCC Edge / Shrub / Successional birds ($F_{2,332} = 5.8382$, $p = 0.0032$), Forest birds ($F_{2,358} = 3.9912$, $p = 0.0193$), Grassland / Open Country birds ($F_{2,136} = 2.5455$, $p = 0.0822$) and Total birds ($F_{2,358} = 5.4810$, $p = 0.0045$) indicating that density at control and impact stations differs depending on the year.

Further analysis revealed that the density of the SCC Edge / Shrub / Successional birds followed a similar trend to that seen for abundance. Density was relatively unchanged between 2014/15 and 2016, then significantly increased at impact stations between 2016 and 2018 ($p = 0.0002$), while decreasing slightly at control stations (not significant; $p = 0.4965$; Table 3-8 and Table 3-9). The density of SCC Edge / Shrub / Successional birds was therefore significantly greater at impact stations in 2018 ($p = 0.0005$) as compared to control stations. The lack of notable change in density at both impact and control stations between 2014/15 and 2016 indicates this guild of species was not adversely impacted by the construction activities being undertaken at the RRM impact stations. The increase in density at impact stations in 2018 and concurrent slight decrease at control stations may indicate that the construction activities have resulted in

disturbed areas which have begun regenerating into preferred edge / shrub / successional habitat for these species causing a shift into these optimal habitats.

Further analysis revealed that the density of the SCC Forest birds followed a similar trend to that seen for abundance. Density was similar at both impact and control stations in 2014/15, then increased at control stations (not significant; $p = 0.3882$) between 2014/15 and 2016, while concurrently decreasing significantly at impact stations ($p = 0.0047$). As such, there was a significantly greater density at control stations than impact stations in 2016 ($p = 0.0004$). Between 2016 and 2018, the density of the SCC Forest birds significantly increased ($p = 0.0381$) at both control and impact stations ($p = 0.0085$). A significantly greater density was maintained at control stations as compared to impact stations in 2018 ($p = 0.0017$). These results indicate that SCC Forest birds may have been adversely affected by increased disturbance and habitat loss from the RRM construction activities. Disturbance typically experienced at impact stations may have included increased noise levels beyond tolerance thresholds and/or habitat degradation due to mine construction activities (e.g., road construction, tree removals) to a point where individuals of these species found alternative nesting territories at control stations in 2016. The subsequent increase in density at both control and impact stations in 2018 may indicate that disturbances at impact stations have decreased now that the RRM has entered the operations phase, and that these species are able to disperse more evenly. However, the sustained significantly greater abundance at control stations indicates habitats around impact stations no longer support as much optimal (forested) habitat for these species.

Further analysis revealed that the density of the SCC Grassland / Open Country birds followed a similar trend to that seen for abundance. Density significantly increased at both the control and impact stations ($p = 0.0086$ and $p = 0.0109$) between 2016 and 2018. This appears to indicate a broad population increase across the overall monitoring area. This could be attributed to the work undertaken by New Gold to maintain high quality grassland bird habitat within the protected Bobolink Overall Benefit lands or the clearing of previously woody vegetated land into anthropogenically open areas introducing new habitat for certain species. In 2014/15, density of SCC Grassland / Open Country birds was significantly greater at impact stations than at control stations ($p = 0.0527$), this could have been due to the greater prevalence of impact stations located within Bobolink Overall Benefit lands (32 stations as opposed to 11 control stations), which provide suitable habitat for birds in this guild. The decrease in abundance at impact stations between 2014/15 and 2016, whilst not significant, may indicate that these species were temporarily adversely affected by construction activities to a point where individuals of these species found alternative nesting territories. The subsequent increase in density at all stations in 2018 may indicate that disturbances at these locations have decreased now that the RRM has entered the operations phase and these species are able to again increase their utilization of habitats at these sites. The assumption of sphericity was violated for the SCC Grassland / Open Country density analysis ($p < 0.0001$) resulting in an increased chance of Type I error, as such results should be interpreted with some caution. In this instance there is a clear trend in the mean densities with non-overlapping standard errors and most of the p-values are relatively low, therefore, it is likely that these assertions are significant despite the violation of sphericity and regardless of significance there is a clear trend in the data and the explanations are still valid.

Further analysis revealed the density of the Total SCC birds followed a similar trend to those observed in the two largest guilds showing interaction effects, SCC Edge / Shrub / Successional birds and SCC Forest birds. Total SCC bird density significantly decreased ($p = 0.0001$) at impact stations between 2014/15 and 2016, followed by a significant increase ($p < 0.0001$) between 2016 and 2018. Total SCC density also slightly (non-significantly) increased ($p = 0.7093$) at control stations between 2014/15 and 2016, followed by a significant increase ($p = 0.0337$) between 2016 and 2018. (Table 3-8 and Table 3-9). These results

corroborate the theory that birds may have been temporarily adversely affected by construction activities at impact stations to a point where individuals found alternative nesting territories (resulting in an increase in density at control stations), however, the subsequent increase in density at impact stations in 2018 supports the theory that disturbances at these locations have decreased now that the RRM has entered the operations phase and that new optimal habitat may have been created through these construction activities to support numerous species across the guilds. The assumption of sphericity was violated for the Total SCC density analysis ($p = 0.0028$) resulting in an increased chance of Type I error, as such results should be interpreted with some caution. In this instance there is a clear trend in the mean densities with non-overlapping standard errors and low p-values, therefore, it is likely that these assertions are significant despite the violation of sphericity.

The analysis for SCC revealed no significant interaction effect between survey station type and year relative to the density of SCC Wetland / Open Water birds. This suggests that the RRM construction and operations have not adversely affected the density of this guild (Table 3-8 and Table 3-9).

The analysis of yearly effects (inclusive of impact and control stations) showed significant fluctuations in the density of SCC Wetland / Open Water birds ($F_{2,268} = 3.445$, $p = 0.0333$) between monitoring years. The density significantly decreased between 2014/15 and 2016 ($p = 0.0276$), followed by a significant increase between 2016 and 2018 ($p = 0.0089$). These results indicate that species within this guild are experiencing broad population fluctuations within the overall monitoring area. The assumption of sphericity was violated for the SCC Wetland / Open Water density analysis ($p < 0.0001$) resulting in an increased chance of Type I error, as such results should be interpreted with some caution. In this instance there is a clear trend in the mean densities with non-overlapping standard errors and low p-values, therefore, it is likely that these assertions are significant despite the violation of sphericity.

The analysis of location effects (inclusive of 2014/15, 2016 and 2018) showed no changes in density between impact and control stations was observed for SCC Wetland / Open Water birds.

Non-Species of Conservation Concern

The analysis for non-SCC revealed significant interaction effects between survey station type and year relative to the density of non-SCC Forest birds ($F_{2,358} = 5.0312$, $p = 0.0070$) and Total non-SCC birds ($F_{2,358} = 3.5550$, $p = 0.0296$) indicating that density at control and impact stations differs depending on the year.

Ruby-crowned Kinglet (Photo: Cephas/Wikimedia Commons)

Further analysis revealed that the density of the non-SCC Forest birds followed similar trends to those described for abundance. Density slightly increased at control stations between 2014/15 and 2016 (not significant; $p = 0.4568$), followed by a significant increase in density between 2016 and 2018 ($p = 0.0562$). At impact stations non-SCC Forest bird density significantly decreased between 2014/15 and 2016 ($p = 0.0009$), followed by a significant increase in density between 2016 and 2018 ($p = 0.0174$). Abundance at control stations was significantly greater than at impact stations for all monitoring years with the largest differences occurring in 2016 followed by 2018. These results indicate this guild may have been adversely affected by increased disturbance and habitat loss from the RRM construction activities. Disturbance typically experienced at impact stations may have included increased noise levels beyond tolerance thresholds and/or habitat degradation due to mine construction activities (e.g., road construction, tree removals) to a

point where individuals of these species found alternative nesting territories in 2016. The subsequent significant increase in density at impact stations in 2018 may indicate that disturbances at these locations have decreased now that the RRM has entered the operations phase and these species are able to disperse more evenly. The sustained significantly greater abundance at control stations indicates habitats around impact stations likely no longer support as much optimal (forested) habitat for these species.

Further analysis revealed that the density of the Total non-SCC birds displays trends similar to those observed for the non-SCC Forest birds. Total non-SCC bird density slightly decreased at control stations between 2014/15 and 2016 (not significant; $p = 0.8085$), followed by a significant increase in density between 2016 and 2018 ($p = 0.0001$). At impact stations Total non-SCC bird density significantly decreased between 2014/15 and 2016 ($p = 0.0012$), followed by a significant increase in density between 2016 and 2018 ($p = 0.0005$). Density at control stations increased from (non-significantly) lower in 2014/15, to (non-significantly) greater in 2016, to significantly greater ($p = 0.0493$) than at impact stations in 2018. These results corroborate the theory that birds may have been temporarily adversely affected by construction activities at impact stations to a point where individuals found alternative nesting territories. The subsequent significant increase in density at impact and control stations in 2018 show a broad increase in birds across the overall monitoring area as well as corroborating the theory that species are able to disperse more evenly now that disturbances at impact stations have decreased with the RRM entering the operations phase. The significantly greater density at control stations in 2018 indicates some species may have been displaced permanently from impact stations due to loss of forest habitat. The assumption of sphericity was violated for the Total non-SCC density analysis ($p = 0.0038$) resulting in an increased chance of Type I error, as such results should be interpreted with some caution. In this instance there is a clear trend in the mean densities with non-overlapping standard errors and low p-values, therefore, it is likely that these assertions are significant despite the violation of sphericity.

The analysis of non-SCC guilds revealed no significant interaction effects between survey station type and year relative to the density of non-SCC Edge / Shrub / Successional birds, Grassland / Open Country birds or Wetland / Open Water birds. This would imply that the RRM construction and operations have not adversely affected the densities of these guilds (Table 3-8 and Table 3-9).

The analysis of yearly effects (inclusive of impact and control stations) showed significant fluctuations in the density of non-SCC Edge / Shrub / Successional birds ($F_{2,354} = 6.5819$, $p = 0.0016$). The density significantly decreased between 2014/15 and 2016 ($p = 0.0047$), followed by a significant increase between 2016 and 2018 ($p = 0.0008$). These results indicate species within this guild are experiencing broad population fluctuations within the overall monitoring area. Additionally, non-SCC Grassland / Open Country birds ($F_{2,122} = 13.6516$, $p < 0.0001$) showed significant increases in density between 2014/15 and 2016 ($p = 0.0054$) and again between 2016 and 2018 ($p = 0.0015$). These results indicate species within this guild are experiencing broad increases within the overall monitoring area. No changes in density between monitoring years were observed for non-SCC Wetland / Open Water birds. The assumption of sphericity was violated for the non-SCC Grassland / Open Country density analysis ($p = 0.0008$) resulting in an increased chance of Type I error, as such results should be interpreted with some caution. In this instance there is a clear trend in the mean densities with non-overlapping standard errors and low p-values, therefore, it is likely that these assertions are significant despite the violation of sphericity.

The analysis of location effects (inclusive of 2014/15, 2016 and 2018) showed that the density of non-SCC Edge / Shrub / Successional birds ($F_{1,177} = 2.8900$, $p = 0.0909$) and non-SCC Grassland / Open Country birds ($F_{1,61} = 12.0017$, $p = 0.0010$) was significantly greater at impact stations compared to control stations. This result is potentially due to a greater prevalence of suitable habitats within the impact areas.

No significant changes in density between impact and control stations were observed for non-SCC Wetland / Open Water birds.

3.1.7 Species Richness by Guild

Statistical comparisons of SCC and non-SCC by guild were conducted to detect significant differences in species richness between monitoring year (2014/15, 2016 and 2018) and survey station type (impact versus control) as summarized in Table 3-10 and Table 3-11. The total species richness of birds between monitoring years and station types was also evaluated, which is inclusive of all four guilds.

Species of Conservation Concern

The SCC analysis revealed a significant interaction effect between survey station type and year relative to the richness of the SCC Edge / Shrub / Successional birds ($F_{2,332}$ = 8.7981, p = 0.0002), Forest birds ($F_{2,358}$ = 4.2230, p = 0.0154), Grassland / Open Country birds ($F_{2,132}$ = 2.9229, p = 0.0573), and Total birds ($F_{2,358}$ = 7.6580, p = 0.0006; Table 3-10 and Table 3-11) indicating that species richness at control and impact stations differs depending on the year.

Further analysis revealed that the richness of the SCC Edge / Shrub / Successional birds follows similar trends to those described for abundance. Richness increased at impact stations between 2014/15 and 2016 (not significant; p = 0.2286), followed by a significant increase in species richness between 2016 and 2018 (p = 0.0062). Concurrently, richness decreased at control stations between 2014/15 and 2016 (not significant; p = 0.5324) and again between 2016 and 2018 (not significant; p = 0.2122). Despite the decreases being non-significant, the richness at control stations in 2018 was significantly lower (p = 0.0.0617) than in 2014/15. The richness of SCC Edge / Shrub / Successional species in 2014/15 was similar at impact and control stations, however, in both 2016 and 2018 richness was significantly greater at impact stations compared to control stations (p = 0.8987 and p < 0.0001). The increase in richness at impact stations between 2014/15 and 2016 substantiates the theory that this guild of species was not adversely impacted by the construction activities being undertaken at the RRM. The increase in richness at impact stations in 2018 and concurrent decrease at control stations supports the theory that the construction activities have resulted in disturbed areas which have begun regenerating into preferred edge / shrub / successional habitat for these species causing a shift into these optimal habitats.

Further analysis revealed that the richness of the SCC Forest birds follows similar trends to those described for abundance. Richness significantly increased at control stations (p = 0.0244) between 2014/15 and 2016 while concurrently decreasing at impact stations (not significant; p = 0.3044). As such, richness was significantly greater at control stations than at impact stations in 2016 (p < 0.0001). Between 2016 and 2018 the richness of SCC Forest birds significantly decreased (p = 0.0858) at control stations while significantly increasing at impact stations (p = 0.0404). These results corroborate the theory that this guild may have been adversely affected by increased disturbance and habitat loss from the RRM construction activities. The subsequent decrease in richness at control stations, coupled with the increase at impact stations in 2018 supports the theory that disturbances at these locations have decreased now that the RRM has entered the operations phase and these species are able to disperse more evenly.

Further analysis revealed the richness of the SCC Grassland / Open Country birds was significantly greater at impact stations compared to control stations in 2014/15 (p = 0.0740). Between 2014/15 and 2016, richness at control stations significantly increased (p = 0.0764) while decreasing at impact stations (not significant; p = 0.1706). Richness increased slightly at both impact and control stations between 2016 and

2018 (not significant; p = 0.2859 and p= 0.7990, respectively), with species richness being similar between the impact stations and control stations in 2018 (1.32 and 1.33, respectively). These results further corroborate the theory that these species were temporarily adversely affected by construction activities to a point where individuals of these species found alternative nesting territories in 2016.The subsequent slight increase in richness between 2016 and 2018 supports the theory that disturbances at the impact locations have decreased now that the RRM has entered the operations phase and these species are able to again increase their utilization of habitats at these sites.

The richness of Total SCC showed trends similar to those observed in the two largest guilds showing interaction effects; SCC Edge / Shrub / Successional birds and SCC Forest birds. Total SCC bird richness significantly increased at control stations between 2014/15 and 2016 (p = 0.0069), followed by a significant decrease in richness between 2016 and 2018 (p = 0.0021). At impact stations there was no notable change in richness between 2014/15 and 2016, however a significant increase in richness occurred between 2016 and 2018. Richness values were similar at impact and control stations (mean richness 6.58 and 6.60, respectively) in 2016, however, richness was significantly greater at impact stations compared with control stations in both 2014/15 and 2018. This further supports the theory that some species were temporarily adversely affected by construction activities to a point where individuals of these species found or chose alternative nesting territories in 2016. The subsequent increase in richness at impact stations between 2016 and 2018, coupled with the decrease in richness at control stations supports the theory that disturbances at the impact locations have decreased now that the RRM has entered the operations phase and species are able to disperse more evenly and again increase their utilization of habitats at these sites.

No significant interaction effect between survey station type and year was observed relative to the richness of SCC Wetland / Open Water birds (Table 3-10 and Table 3-11); however, the analysis of yearly effects (inclusive of impact and control stations) showed a significant fluctuation in the richness of SCC Wetland / Open Water birds between monitoring years ($F_{2,268}$ = 5.7960, p = 0.0034). Richness significantly increased between 2014/15 and 2016 (p = 0.0095), followed by a significant decrease in richness between 2016 and 2018 (p = 0.0024). This result indicates SCC Wetland / Open Water species are experiencing broad fluctuations of richness within the overall monitoring area.

The analysis of location effects (inclusive of 2014/15, 2016 and 2018) showed no changes in richness between impact and control stations for SCC Wetland / Open Water birds (Table 3-10 and Table 3-11).

Non-Species of Conservation Concern

The analysis for non-SCC revealed significant interaction effects between survey station type and year relative to the richness of non-SCC Forest birds ($F_{2,358}$ = 4.6000, p = 0.0107) and Total non-SCC birds ($F_{2,358}$ = 4.3820, p = 0.0132; Table 3-10 and Table 3-11) indicating that species richness at control and impact stations differs depending on the year.

Further analysis revealed the richness of non-SCC Forest species follows similar trends to those described for abundance. Richness significantly increased at control stations (p = 0.0118) between 2014/15 and 2016 while concurrently decreasing at impact stations (not significant; p = 0.1499). Richness was consistently significantly greater at control stations than impact stations across all monitoring years. This difference was most pronounced in 2016 (p < 0.0001). Between 2016 and 2018, the richness of non-SCC Forest birds decreased (not significant; p = 0.1295) at control stations while significantly increasing at impact stations (p = 0.0627). These results corroborate the theory that this guild may have been adversely

affected by increased disturbance and habitat loss from the RRM construction activities. The subsequent decrease (non-significant) in richness at control stations, coupled with the increase at impact stations in 2018 supports the theory that disturbances at these locations have decreased now that the RRM has entered the operations phase and these species are able to disperse more evenly.

Further analysis revealed Total non-SCC bird richness trends are similar to those observed for non-SCC Forest birds. Total non-SCC bird richness significantly increased at control stations ($p = 0.0716$) between 2014/15 and 2016 while concurrently decreasing at impact stations (not significant; $p = 0.1192$). Richness was therefore significantly greater at control stations than at impact stations in 2016 ($p = 0.0920$). Between 2016 and 2018, richness decreased (not significant; $p = 0.8741$) at control stations while significantly increasing at impact stations ($p < 0.0001$). These results support the theory that some species have been adversely affected by increased disturbance and habitat loss from the RRM construction activities. However, disturbances at these locations have decreased now that the RRM has entered the operations phase and these species are able to disperse more evenly.

No significant interaction effect between survey station type and year was observed relative to the richness of non-SCC Edge / Shrub / Successional, Grassland / Open Country or Wetland / Open Water species (Table 3-10 and Table 3-11).

The analysis of yearly effects (inclusive of impact and control stations) showed a significant fluctuation in the richness of non-SCC Edge / Shrub / Successional birds ($F_{2,354} = 7.4605$, $p = 0.0007$) between monitoring years. Richness decreased significantly between 2014/15 and 2016 ($p = 0.0098$) and increased significantly between 2016 and 2018 ($p = 0.0002$). Similar to the results for abundance and density, these results indicate that species within this guild are experiencing broad fluctuations within the overall monitoring area. The analysis of yearly effects also showed significant increases in the richness of non-SCC Grassland / Open Country birds ($F_{2,122} = 9.5910$, $p = 0.0001$) and non-SCC Wetland / Open Water birds ($F_{2,198} = 6.3257$, $p = 0.0022$). Non-SCC Grassland / Open Country bird richness significantly increased between 2014/15 and 2016 ($p = 0.0090$) and again between 2016 and 2018 ($p = 0.0422$). Similarly, non-SCC Wetland / Open water bird richness significantly increased between 2014/15 and 2016 ($p = 0.0457$) and again between 2016 and 2018 ($p = 0.0004$). Similar to the results for abundance and density, this indicates that these species are experiencing broad population increases within the overall monitoring area.

The analysis of location effects (inclusive of 2014/15, 2016 and 2018) revealed that the richness of non-SCC Edge / Shrub / Successional species ($F_{1,177} = 5.8888$, $p = 0.0162$) and non-SCC Grassland / Open Country species ($F_{1,61} = 16.5067$, $p = 0.0001$) were significantly greater at impact stations compared to control stations. This result suggests that habitat for non-SCC Edge / Shrub / Successional species and non-SCC Grassland / Open Country species may be more prevalent at impact stations. No significant differences between impact and control stations were observed for non-SCC Wetland / Open Water species (Table 3-10 and Table 3-11).

3.2 Other Taxa (Incidental Observations)

White-tailed Deer (*Odocoileus virginianus*) were commonly observed throughout the NLSA as were their tracks and droppings, indicating a high level of local habitat use by this species. Similarly, evidence of Beaver (*Castor canadensis*) activity such as dams, lodges and chewed stumps were widespread throughout the NLSA.

The only avian species documented incidentally which was not also recorded during morning point count surveys was Common Nighthawk (Appendix A).

Table 3-1: Summary of Percent Occurrence of Dominant Species between 2016 and 2018 Monitoring Years

Species	Year	Impact (n = 90)			Control (n = 95)		
		Max. Birds Observed	No. of Stations Observed	Percent of Stations Observed	Max. Birds Observed	No. of Stations Observed	Percent of Stations Observed

4.0 Conclusions

A total of 132 bird species were recorded during the 2018 morning point count surveys, of which 113 species were recorded at impact stations and 120 species were recorded at control stations. A total of 54 bird SCC were documented, of which 45 species were recorded at impact stations and 48 species were recorded at control stations. These 54 species are all considered BCR 12 priority species with 12 of them further designated as SAR. The SAR are discussed further in the *2018 RRP Species at Risk Report* (Wood 2018).

Based on the percent occurrence, abundance and density there was significant overlap of the overall dominant species between impact and control stations and between monitoring years.

Based on the analyses undertaken for the most commonly occurring species, abundance and density values followed similar trends for each species, especially for those species with significant interaction effects present (i.e., interaction between station type and year indicating the RRM is having some effect).

Based on the analyses of the most widely occurring SCC, Chestnut-sided Warbler, Song Sparrow and White-throated Sparrow all showed significant interaction effects between site type and year, indicating that the RRM has had an effect on these species. Neither Chestnut-sided Warbler nor Song Sparrow showed a negative effect at impact stations in 2016 (construction), indicating that these species did not appear to have been adversely impacted by the construction activities being undertaken at the RRM impact stations. Both species experienced increases in abundance and density at impact stations in 2018 with concurrent decreases at control stations, suggesting that the construction activities may have resulted in the creation of early successional habitat preferred by species belonging to the Edge / Shrub / Successional habitat guild, causing some species to shift into these new optimal habitats. White-throated Sparrow showed a significant decrease in abundance and density at impact stations between 2014/15 and 2016 but not at control stations. This suggests that this species may have been negatively impacted by construction activities being undertaken at the RRM impact stations. Individuals may have avoided impact stations in 2016 and established breeding territories further away from construction activities. Abundance and density of White-throated Sparrow in 2018 appear similar between impact and control stations, potentially due to individuals dispersing more evenly in 2018 (post-construction) once habitats around impact stations were no longer undergoing active disturbance (Table 4-1).

Based on the analyses of the most widely occurring non-SCC, Red-eyed Vireo, Black-and-white Warbler and Hermit Thrush all showed significant interaction effects between location type and year, indicating the RRM has had some effect on these species. Black-and-white Warbler abundance and density were slightly higher at impact stations than control stations in 2014/15. Both metrics were significantly higher at control stations in 2016 and then returned to similar values between station types in 2018. This indicates individuals may have been preferentially choosing control stations in 2016 to be further away from construction activities. Additionally, these species may have been dispersing more evenly in 2018 (post-construction), once habitats around impact stations were no longer undergoing active disturbance. Hermit Thrush showed overall population declines. Density of this species was slightly higher at impact stations in 2014/15, then decreasing at impact stations in 2016 and 2018. In 2018, the density of this species was greater at control stations than at the impact stations. This indicates that, in addition to the overall decreases in density, this species may be preferentially choosing control stations as optimal forested habitat was removed near the impact stations. Red-eyed Vireo density was significantly lower in 2016 at both the impact and control stations when compared with 2014/2015and 2018. Density of this species was significantly greater at control stations than at impact stations in all monitoring years, with the

greatest difference between station types observed in 2018. These results are likely in part due to population fluctuations across the overall monitoring area, combined with some avoidance of impact stations in 2016 due to increased construction activities. The increase in density at control stations in 2018 is likely because habitats around impact stations no longer support as much optimal (forested) habitat for this species (Table 4-1).

Based on the analysis of the most commonly occurring SCC, there was a significant increase in the abundance and density of Veery between 2016 and 2018. This implies that this species may be experiencing a population increase within the overall monitoring area. A significantly greater abundance of Common Yellowthroat was recorded at impact stations than control stations, though this trend was not observed for density. This increased abundance of Common Yellowthroat may be due to a prevalence of suitable habitat for this species at the impact stations.

Based on the analysis of the most commonly occurring non-SCC, abundance fluctuated across years for several species. Red-eyed Vireo abundance initially decreased between 2014/15 and 2016 followed by an increase between 2016 and 2018. Conversely, Blue Jay showed the opposite trend with an increase in abundance between 2014/2015 and 2016 followed by a decrease between 2016 and 2018. The density of Blue Jay also significantly decreased between 2016 and 2018. American Robin abundance increased between 2016 and 2018. This implies that these species may be experiencing population changes within the overall monitoring area. Red-eyed Vireo and Ovenbird showed significantly greater abundance (Ovenbird also showed greater density) at control stations than at impact stations, which may be due to the prevalence of forested habitat at locations further removed from mine activities.

Half of the most widely occurring species experienced no interaction effects between station type and year for either abundance or density, suggesting the RRM has not had an adverse effect on several of the most widely occurring species. Additionally, the recurring trend of these metrics increasing for several species at impact stations post-construction (2018) indicates that any disturbance effects of mine construction were likely temporary and reversible and, in some cases, possibly beneficial in providing optimal habitat for some species (especially those preferring successional habitats).

Based on the analysis of guilds, species abundance, density and richness followed similar trends for both SCC and non-SCC birds, although the level of significance for these trends varied between the guilds. Overall, the RRM operations did appear to have some effect on species abundance or density for several guilds. Decreases in abundance and density were noted for some guilds, particularly in 2016 (construction). However, the abundance and density of several guilds subsequently increased between 2016 and 2018 (Table 4-1). This suggests that some species may be less sensitive to disturbance from the RRM operations and / or habitats for these species are either still available or enhanced at the impact stations post-construction.

SCC Edge / Shrub / Successional bird population metrics remained relatively unchanged between 2014/15 and 2016, indicating that this guild of species was not adversely impacted by the construction activities being undertaken at the RRM impact stations. Between 2016 and 2018, abundance, density and richness increased at impact stations while decreasing at control stations. This may indicate that construction activities resulted in the creation of edge / shrub / successional habitat preferred these species, causing them to shift into these optimal habitats.

No change in abundance was detected between location types over time (interaction effect) for Non-SCC Edge / Shrub / Successional birds, implying that the RRM construction and operations have not affected

the abundance of this guild. Abundance and density of these species was greater at impact stations compared with control stations, potentially due to a greater prevalence of suitable habitats within impact areas. Abundance, density and richness for these species did vary over time, a decrease in these metrics for these species was recorded in 2016 followed by a subsequent increase in 2018. This would suggest that these species are experiencing population fluctuations within the overall monitoring area.

Both SCC and non-SCC Forest birds exhibited similar differences in population metrics between location types and year. Abundance and richness increased at control stations between 2014/15 and 2016, and decreased between 2016 and 2018. Conversely, at impact stations, these metrics decreased between 2014/15 and 2016 and increased between 2016 and 2018. This indicates that these species may have been negatively impacted by construction activities being undertaken at the RRM impact stations. Individuals may have avoided impact stations in 2016 and established breeding territories further away from construction activities (causing increases at control stations). Population metrics were similar at impact and control stations in 2018, potentially due to individuals dispersing more evenly post-construction, once habitats around impact stations were no longer undergoing active disturbance. Forest birds are frequently more common at control stations as compared to impact stations indicating that there is more optimal (forested) habitat for these species further from the RRM.

Birds belonging to the SCC Grassland / Open Country guild showed some non-significant trends in abundance and density between 2014/15 and 2016. These metrics decreased at impact stations while increasing at control stations, indicating that these species may have been temporarily adversely affected by construction activities, thereby temporarily displacing individuals of these species to alternative nesting territories. Between 2016 and 2018 abundance and density significantly increased at both control and impact stations, indicating a population increase across the overall monitoring area. This could be partly attributed to the work undertaken by New Gold to maintain high quality grassland bird habitat within the protected Bobolink Overall Benefit lands. Since disturbances at these locations have decreased and the RRM has entered the operations phase, populations of these species have increased, suggesting that they are once again able to fully utilize these habitats.

No change in abundance was detected between location types and year for Non-SCC Grassland / Open Country birds, implying that the RRM construction and operations have not affected the abundance of this guild. Abundance, density and richness of these species were higher at impact stations than control stations, which is likely a result of the higher number of impact stations located within Bobolink Overall Benefit lands. Thirty-two (32) impact stations are located in the Bobolink Overall Benefit lands, compared with only 11 control stations. An increase in these same population metrics was recorded across monitoring years, indicating that these species are experiencing population increases within the overall monitoring area.

No change in abundance was detected between location types and year for SCC Wetland / Open Water birds, implying that the RRM construction and operations have not affected the abundance of this guild. The abundance of these species was higher at impact stations compared with control stations, potentially due to a prevalence of suitable habitats within impact areas. Density and richness showed an inverse relationship over time, whereby density decreased between 2014/15 and 2016, followed by an increase between 2016 and 2018. Conversely, richness increased between 2014/2015 and 2016, followed by a decrease between 2016 and 2018. This suggests that these species are experiencing population fluctuations within the overall monitoring area. As there is limited wetland habitat within the NLSA, it is possible that these trends have been magnified based on limited sample sizes as no explanation is apparent. Future monitoring could identify potential sources of these changes.

The abundance of Non-SCC Wetland / Open water birds in 2014/15 was significantly greater at impact stations than at control stations. In 2016, abundance increased slightly at both impact and control stations, indicating that these species did not seem to be negatively impacted by construction activities being undertaken at the RRM impact stations. In 2018, abundance decreased slightly at impact stations, while increasing significantly at control stations, potentially indicating that these species are preferentially choosing control stations. Further years of surveys will be needed to confirm and explain this trend.

Total SCC birds showed similar trends to those noted above for the larger guilds contained within it. This group showed clear decreases in abundance at impact stations in 2016, while concurrently showing marked increases at control stations. This may indicate that some species may have been negatively impacted by construction activities undertaken at impact stations. Individual SCC birds may have avoided impact stations in 2016 and established breeding territories further away from construction activities either at control stations or further afield. An opposite trend was observed in 2018 when abundances increased at impact stations and simultaneously decreased at control stations. This may potentially be due to individuals dispersing more evenly in 2018 (post-construction), when habitats around impact stations were no longer undergoing active disturbance.

No significant differences in the abundance of total non-SCC birds were recorded between location types and year, implying that the RRM construction and operations did not affect the majority of non-SCC species. An increase in the abundance of non-SCC birds was recorded across all monitoring years. Decreases in Total non-SCC bird density and richness were recorded at impact stations in 2016, followed by increases in these metrics in 2018. This trend supports the theory that some species may have been temporarily negatively impacted by construction activities undertaken at impact stations in 2016. However, individuals appear to be dispersing more evenly in 2018 (post-construction) now that habitats around impact stations are no longer undergoing active disturbance.

The culmination of results suggests that the RRM activities (i.e., construction activities and operations) have not significantly adversely affected avian populations in the long term. The progression into mine operation activities and the decrease in intensive disturbances appears to have allowed these species to re-disperse evenly and for some, to move into optimal regenerating habitats created by the construction activities (Table 4-1).

Despite the apparent lack of long-term adverse effects on avian populations, it is unclear whether productivity (e.g., clutch size and fledgling rate) or rates of depredation have been affected by the RRM operations. In cases where bird abundance, density and richness increase, yet productivity decreases, and depredation increases, a ‘sink’ population may be produced in which immigration rates are higher that emigration rates (or death rates are greater than birth rates), resulting in a population decline. A ‘sink’ population is in contrast to a ‘source’ population, in which populations grow due to greater emigration than immigration (or birth rates are greater than death rates). Further studies that include productivity measures in addition to the population metrics may provide further insight into the effect of mining operations on bird populations.

Table 4-1: Summary of Significant Yearly, Location and Interaction Effects on Avian Community

Species / Guild	Abundance	Density	Richness
Species Effects – SCC			
Nashville Warbler	Nil	Nil	N/A

Notes:

Highlighted cells represent interaction effects
Nil denotes no significant trend revealed
Increase/Decrease denotes change between specified years
> denotes location effect showing metric greater at either control or impact stations across all monitoring years
N/A – not applicable
2015 = 2014/15 combined baseline survey years

Notes:

α Distribution (Percent Occurrence) = number of point count stations at which a species was recorded divided by the total number of point counts surveyed
Abundance = maximum number of individuals per species divided by the total number of point count stations
Density = maximum number of individuals per species recorded within 100m radius of the surveyor divided by the area of the survey station (=3.1416 ha)

* BCR 12 Priority Species

Notes:

[α] Distribution (Percent Occurrence) = number of point count stations at which a species was recorded divided by the total number of point counts surveyed;
Abundance = maximum number of individuals per species divided by the total number of point count stations;
Density = maximum number of individuals per species recorded within a 50 m radius of the surveyor divided by the area of the survey station (= 0.79 ha).

* BCR 12 Priority Species

[β] Species provincially-listed as *Special Concern* under the *Endangered Species Act*

[γ] Species provincially-listed as Threatened or Endangered under the *Endangered Species Act*

Notes:

- α Distribution (Percent Occurrence) = number of point count stations at which a species was recorded divided by the total number of point counts surveyed;
  Abundance = maximum number of individuals per species divided by the total number of point count stations;
  Density = maximum number of individuals per species recorded within a 50 m radius of the surveyor divided by the area of the survey station (= 0.79 ha).
- * BCR 12 Priority Species
- β Species provincially-listed as Special Concern under the Endangered Species Act
- γ Species provincially-listed as Threatened or Endangered under the Endangered Species Act

Notes:

- α Distribution (Percent Occurrence) = number of point count stations at which a species was recorded divided by the total number of point counts surveyed;
  Abundance = maximum number of individuals per species divided by the total number of point count stations;
  Density = maximum number of individuals per species recorded within a 100 m radius of the surveyor divided by the area of the survey station (= 3.1416 ha).
- * BCR 12 Priority Species
- β Species provincially-listed as Special Concern under the Endangered Species Act
- γ Species provincially-listed as Threatened or Endangered under the Endangered Species Act

Executive Summary

Environmental baseline studies and wildlife monitoring for the RRM have been undertaken annually since 2009. These studies have established a comprehensive understanding of the composition of local plant and wildlife communities within the Project footprint as well as on surrounding lands. Environmental baseline studies for bats were undertaken at the RRM by Wood (formerly AMEC) in 2012 and 2013. As part of the federal environmental assessment process, New Gold committed to follow-up wildlife monitoring programs to verify the accuracy of the environmental assessment predictions. This current report provides the methods and results from the 2015 to 2018 bat acoustic monitoring program.

Annual bat acoustic monitoring was conducted at five monitoring stations between 2015 and 2018 during the maternal brood rearing period in June and early July. Bat acoustic surveys were designed to target two bat SAR whose ranges overlap with the study area and have previously been identified within the Project footprint: Little Brown Myotis and Northern Myotis. Recordings were identified to species using SonoBat™ software and were verified manually using parameters such as frequency of maximum energy, minimum and maximum frequency, call duration, slope of the call, and other qualitative parameters.

Acoustic monitoring has consistently recorded all six species of bat anticipated to be present, based on current known ranges: Little Brown Myotis, Northern Myotis, Eastern Red Bat, Silver-Haired Bat, Hoary Bat and Big Brown Bat. Little Brown Myotis and Northern Myotis are both designated as Endangered Species under Ontario's ESA, which prohibits harming, destroying or disturbing habitat for this species under Sections 9 and 10 of the Act.

Little Brown Myotis and Silver-haired Bats have been consistently detected at the highest frequencies and widest distributions followed by Hoary Bat. Eastern Red Bat and Big Brown Bat are both widespread and have been consistently detected at relatively low frequencies while Northern Myotis has the lowest level of detection and the smallest consistent distribution.

During the spring maternal brood rearing period surveys, Northern Myotis made up 0.16% and 0.06% (2 passes) of all recorded passes in 2015 and 2016 respectively. Despite this low sample size, it appears Detector 23 may have slightly higher activity levels for this species than the other detector locations. This is consistent with the wooded habitat present at this location.

Little Brown Myotis was recorded at all five survey locations within the RRM study area at relatively high levels, particularly in 2015 and 2017. In 2015, 52% of all passes were by Little Brown Myotis or Myotis species and in 2017 these species represented 34% of all passes. Little Brown Myotis and Myotis species passes appear to have their highest detection rate consistently at Detector 21. Between 2015 and 2017 detections of these species at Detector 21 made up between 68% to 93% of their overall detections. The same pattern was present for Silver-haired Bat with the highest number of passes per night for this species recorded at this detector during each maternal brood rearing survey period.

Due to issues with the acoustic surveys during the maternal brood rearing period in 2018 a survey was undertaken in early fall. During this survey period several activity levels for non-SAR bat species survey were the highest of the entire study. Silver-haired Bat numbers (passes per night) were relatively high at every detector location during this survey period and Detector 25 had the highest number of nightly passes over the entire study for Eastern Red Bat, Hoary Bat, Big Brown Bat and the second highest number of nightly passes for Silver-haired Bat.

1.0 Introduction

1.1 Project Background

New Gold Inc. (New Gold) is constructing, operating and eventually reclaiming a new open pit and underground gold mine, the Rainy River Mine (RRM; the Project). The RRM will produce doré bars (gold with silver) for sale. Physical works related to the RRM will consist primarily of:

- Open pit and underground mine;
- Overburden, mine rock and low grade ore stockpiles;
- Primary crusher and process plant;
- Tailings management area;
- 230 kilovolt transmission line;
- Relocation of a portion of gravel-surfaced Highway 600; and
- Associated buildings, facilities and infrastructure.

The RRM site is located in the Township of Chapple, District of Rainy River, in northwestern Ontario, approximately 65 kilometres (km) northwest of Fort Frances, and 420 km west of Thunder Bay (Figure 1-1). Lands immediately adjacent to the RRM are typically gently rolling to flat, forested wetlands in low-lying areas, rounded bedrock outcrops and subcrops in upland areas and areas that have been cleared for agriculture. Local drainage systems are characterized by small creeks that flow to the Pinewood River which drains most of the RRM site area.

Environmental baseline studies and wildlife monitoring for the RRM have been undertaken annually since 2009 within the Natural Environment Local Study Area (NLSA) and the wider Regional Study Area (as defined in AMEC 2014; Figure 1-2). These studies have established a comprehensive understanding of the composition of local plant and wildlife communities within the Project footprint as well as on surrounding lands (i.e., the Study Area). Environmental baseline studies for bats were undertaken at the RRM by Wood Environment & Infrastructure Solutions, a Division of Wood Canada Limited (Wood; formerly AMEC) in 2012 and 2013. Initial acoustic surveys during these baseline studies revealed the presence of six bat species within the proposed RRM footprint, including two species designated as Endangered: Little Brown Myotis (*Myotis lucifugus*) and Northern Myotis (*Myotis septentrionalis*).

The assessment of potential environmental impacts for the RRM was summarized in the RRM Final Environmental Assessment Report (Environmental Impact Statement) Version 2 (AMEC 2014) submitted to the Federal and Provincial Governments, including for Aboriginal and public review. A positive federal Environmental Assessment (EA) Decision Statement was issued on January 12, 2015 and a favourable provincial EA Notice of Approval was released on January 29, 2015.

As a component of the federal EA process, Amec Foster Wheeler Environment & Infrastructure (currently Wood Environment & Infrastructure), was retained to create and implement a Follow-up Monitoring Plan (FMP). In accordance with the *Canadian Environmental Assessment Act, 2012* (CEAA 2012) the purpose of the FMP is to verify the accuracy of the predictions made in the EA about the potential impacts of the

Project on wildlife and wildlife habitat, and to monitor the effectiveness of rehabilitation efforts for wildlife habitat and terrestrial environments. This bat acoustic monitoring report has been created to support the objectives of the FMP and presents the results of bat acoustic monitoring surveys undertaken between 2015 and 2018.

1.2 Objective and Scope

Noise disturbance can cause adverse effects on wildlife, particularly bats, in a variety of ways, most notably interference with acoustic signals. Bats rely heavily on vocal and auditory feedback for foraging and navigation. Anthropogenic noise can interfere with these signals and deter bats (Schaub et al. 2008, Arnett et al. 2013, Bunkley et al. 2015). Additionally, bats rely on, and are relatively faithful to specific habitat features with particular conditions for roosting, mating and hibernation, the latter two being relatively uncommon in the landscape, and anthropogenic disturbance may drive bats to abandon these areas. Chronic noise disturbance can decrease breeding success, increase mortality rates and lead to an overall decrease in population density and/or species diversity (USFWS 2012).

Bat acoustic studies were undertaken annually between 2015 and 2018 to fulfill the following objectives:

- Provide an annual reassessment of bat acoustic survey results;
- Monitor current bat populations as compared to baseline bat acoustic surveys at the RRM;
- Confirm the continued presence or absence of Endangered Little Brown Myotis and Northern Myotis within the RRM Natural Environment Local Study Area (NLSA; as shown in Figure 1-2);
- Begin to identify any long-term population changes and implications of any such changes.

2.0 Methodology

2.1 Existing Information Review

A list of bat species likely to occur within the RRM Study Area was generated from inventory maps in the Atlas of the Mammals of Ontario (Dobbyn 1994) and up-to-date range maps provided by Bat Conservation International (BCI 2018). Six bat species, including two SAR, were found to potentially occur in the vicinity of the RRM: Little Brown Myotis, Northern Myotis, Big Brown Bat (*Eptesicus fuscus*), Silver-Haired Bat (*Lasionycteris noctivagans*), Hoary Bat (*Lasiurus cinereus*) and Eastern Red Bat (*Lasiurus borealis*). All six species were confirmed to occur within the RRM footprint during the baseline studies in 2012 and 2013.

2.2 Bat Acoustic Surveys

To support the objectives of the FMP and to monitor RRM-induced effects on bats, Wood conducted annual bat acoustic monitoring at five monitoring stations between 2015 and 2018. Bat acoustic surveys were designed to target two bat SAR whose ranges overlap with the study area and have previously been identified within the Project footprint: Little Brown Myotis and Northern Myotis. Both species are designated provincially and federally as Endangered. The program focused on confirming the continued presence of these SAR and other bat species and to monitor the level of activity and relative abundance of all bat species at representative locations around the periphery of the mine site and in nearby compensatory property (Figure 2-1).

Bat acoustic surveys were conducted annually between 2015 and 2018 to detect nocturnal bat activity, generally during the maternal brood rearing period in June and early July. All nocturnal bat activity was recorded from 30 minutes before sunset to 30 minutes after sunrise. During each annual recording period, five ultrasonic recording detectors were deployed throughout the study area (Figure 2-1). From 2015-2017, Songmeter SM2Bat+ (Wildlife Acoustics Inc.) recorders paired with SMX-US and SMX-UT microphones were used, while in 2018, a combination of SM2Bat+ recorders with SMX-UT microphones and SM4BAT recorders with SMM-U1 microphones were used. Details of the yearly bat detector deployment dates are provided in Table 2-1. Whenever possible, based on other RRM field program schedules, two rounds of acoustic monitoring were conducted.

Prior to deployment, an ultrasonic calibrator (Wildlife Acoustics Inc.) that emitted a 40 kilohertz (kHz) pure tone was used to verify the sensitivity and proper functioning of the bat detector microphones. Detectors were positioned 2 to 4 metres (m) above ground at representative locations with characteristics likely to result in higher levels of bat activity, such as the edges of wetlands and woodlands and / or near natural corridors to potential feeding areas (Furlonger et al. 1987). Bat detectors were configured to begin recording when ultrasonic signals greater than 18 decibels (dB) above the noise floor rolling average were detected. Upon trigger, a 2 to 5 second recording was saved. A signal process then filtered recorded signals and retained those files resembling bat echolocation. All recordings were made in .wav format with a 384 kHz sampling frequency and 16 bit resolution, producing real time, full spectrum data that afford greater accuracy and confidence when identifying recordings of bat calls to species.

Recordings were identified to species using SonoBat 3.2.0 NE.vi (Sonobat^{TM}) automated processing software (for Ontario and United States, north and northeast). Recordings were also classified manually because, while automated classification can provide accurate classifications for clear recordings that have a high signal to noise ratio, most field recordings contain some level of noise which can limit the accuracy of automated software and its ability to detect echolocation calls within recordings. Recordings were first

examined for saturated calls (calls with a noise level that surpassed the limits of the recording equipment). Saturated calls were removed from recordings with Audacity software to ensure better identification of calls by the species identification software. If all calls within a recording were saturated, the volume of the recording was reduced, and the clipped sections of the calls were digitally corrected with Audacity software. For these calls, amplitude information was not used to identify the calls to species. While automated classification provides efficient classification of large numbers of echolocation recordings, studies on the accuracy of automated classification caution on relying solely on this method (Menon et al. 2018, Rydell et al. 2017, Lemen et al. 2015). Therefore, a subset of the recordings for each year was also classified manually. While poor recording quality or call feature overlap can lead to inaccurate classifications by the software, the software is able to accurately distinguish between High-frequency bats and Low-frequency bats. The former group emits calls with a minimum frequency above 35 kHz and includes all SAR species as well as the Eastern Red Bat, while the latter, emits calls with a minimum frequency below 35 kHz. Since we were confident that all classifications by the software to a low-frequency species were unlikely to be an inaccurately classified SAR species, recordings selected for manual vetting included only those classified to SAR species. Due to the volume of recordings, we also limited the manual vetting to 200 passes for a given species at a given detector.

Automated classification used the mean classification decision method in Sonobat. Individual calls within a recording were classified based on over 30 acoustic parameters. The software used a discriminant analysis to provide an accuracy probability for each classification and only calls with a probability greater than 90% were accepted. The calls within a sequence are sorted hierarchically and processed to generate a mean classification decision. Manual classification was accomplished by comparing qualitative and quantitative parameters of recorded bat calls to a library of known species parameters. Parameters used for species identification included: frequency of maximum energy, minimum frequency, maximum frequency, call duration, slope of the call, and other more qualitative parameters such as the time-frequency shape of the call, the position of the knee, presence of inflections and terminal curvatures (see diagram in Appendix A). Less importance was placed on maximum frequency due to its susceptibility to atmospheric attenuation. Calls that could not be classified to a single species were placed in a group named after the two or more species most likely to have produced the call.

2.2.1 Exceptions to Standard Methodology

In 2016 microphone sensitivity was found to be extremely variable during routine calibration testing, likely due to the age of the microphones and different weathering conditions attained through use in previous seasons. In an attempt to determine qualitative differences in detectability, bat detectors were 'paired' at the RRM in 2016 to allow a comparison of recorded data. This involved deploying two bat detectors at each location, one with a known 'good condition' microphone with high sensitivity (>17 dB) paired with a known 'poor condition' microphone with lower sensitivity (<30 dB). The results of this comparison are provided in Appendix B. The data used in this report was that obtained from the detector with higher sensitivity to ensure the most accurate results are presented.

In 2018 two bat detectors failed to collect data for unknown reasons and the other three detectors had suspicious gaps in the recorded data. Factors could have included inclement weather, natural bat population fluctuations, microphone sensitivity, detector faults, human error or a combination of these factors. As only three of the five detectors collected data during the maternal brood rearing period, a second round of monitoring was undertaken in early fall to supplement the study program.

Table 2-1: Details of Bat Acoustic Surveys Completed

Year	Detector	Round [1]		Round [2]		Combined

	Detector 25	June 2 – June 16	15	July 1 – July 16	16	31
2018[2]	Detector 20	--	--	Aug 12 – Sept 6	26	N/A
	Detector 21	June 21 – June 27	7	Aug 12 – Sept 7	27	N/A
	Detector 23	June 2 – July 2	31	Aug 12 – Sept 7	27	N/A
	Detector 24	June 1 – June 27	27	Aug 12 – Sept 6	26	N/A
	Detector 25	--	--	Aug 12 – Sept 6	26	N/A

Notes:

Detectors were only deployed for one round in 2016.

Detector failures in 2018 led to minimal data collected during maternal brood rearing period and a later round 2 of collection in early fall, as such a total recording period was used for each round rather than the entire season.

3.0 Results

Subsequent to the baseline surveys undertaken in 2012 and 2013, acoustic bat monitoring was conducted annually between 2015 and 2018. A compiled species list with respective provincial rank, SAR status, relevant protective acts and details on the years species have been detected is provided in Table 3-1.

Calls that could not be classified to a single species were placed into separate paired classes (e.g., Myotis species, LANO/EPFU) if possible and where this level of classification was not possible, calls were placed into high-frequency, low-frequency or unknown groupings.

3.1 Bat Acoustic Surveys

2015 Bat Acoustic Surveys

Acoustic bat monitoring during 2015 produced records of all six bat species anticipated to be present in the RRM area based on existing data sources: Little Brown Myotis, Northern Myotis, Big Brown Bat, Silver-Haired Bat, Hoary Bat and Eastern Red Bat. A total of 13,958 passes were recorded during the maternal brood rearing period (June to early July) over a total of 141 recording nights. Little Brown Myotis were recorded at all five survey locations and had the highest frequency of occurrence (35.3%; 4,921 passes). Another 17.3% of the total recorded passes were classified as Myotis species (either Little Brown Myotis or Northern Myotis) (Table 3-2). Silver-haired Bats, Hoary Bats and Eastern Red Bats were recorded at all five survey locations, with the next highest frequencies of occurrence (18.4%, 5.5% and 2.8% of the total recorded passes, respectively). Big Brown Bat and Northern Myotis had low frequencies of occurrence (0.3%; 37 passes and 0.2%; 22 passes, respectively) with Big Brown Bat recorded at all five survey stations and Northern Myotis at four of the five survey locations. The combination of Silver-haired Bat or Big Brown Bat had an occurrence frequency of 0.3% of the total recorded passes while the combination of Little Brown Bat or Eastern Red Bat had a very low frequency of occurrence with less than 0.01% of total recorded passes.

A total of 2,801 passes could not be classified to species or species pair; 2,450 of these were from high-frequency species, 350 were from low-frequency species, and one could not be classified, likely as a result of poor recording quality.

The acoustic activity of bats during the first recording period (early June to late June) averaged 125.29 passes per night (passes/night) at Detector 20 (D20), 529.25 passes/night at D21, 43.09 passes/night at D23, 45.31 passes/night at D24 and 14.53 passes/night at D25. The acoustic monitoring of bats during the second recording period (late June to mid-July) recorded less passes than the first round and averaged 26.33 passes/night at D20, 203.79 passes/night at D21, 14.86 passes/night at D23, 44.40 passes/night at D24 and 20.93 passes/night at D25 (Table 3-2). Several species, particularly Little Brown Myotis, showed a substantial decrease in activity during the later survey period.

2016 Bat Acoustic Surveys

Acoustic bat monitoring during 2016 produced records of all six bat species anticipated to be present in the RRM area based on existing data sources: Little Brown Myotis, Northern Myotis, Big Brown Bat, Silver-Haired Bat, Hoary Bat and Eastern Red Bat. A total of 3,591 passes were recorded during the maternal brood rearing period (June to early July) over a total of 69 recording nights. Silver-haired Bats and Hoary Bats were recorded at all five surveys stations with the two highest frequencies of occurrence (32.4% and

25.3% of the total passes recorded, respectively). Little Brown Myotis were also recorded at all five survey locations and with a relatively high frequency of occurrence (10.6%; 330 passes). Another 12.8% of the total passes were classified as Myotis species (either Little Brown Myotis or Northern Myotis) (Table 3-3). Eastern Red Bats and Big Brown Bats were both recorded at low frequencies of occurrence (1.3%; 46 passes and 0.4%; 22 passes respectively) with Eastern Red Bat recorded at all five survey stations and Big Brown Bat at four of the five survey locations. Northern Myotis were recorded twice at a single survey station, representing 0.06% of the total passes recorded. The combination of Silver-haired Bat or Big Brown Bat had a frequency of occurrence of 0.6% of the total passes recorded while the combination of Little Brown Bat or Eastern Red Bat had an even lower frequency of occurrence making up 0.2% of the total passes recorded.

A total of 591 passes could not be classified to species or species pair; 370 of these were from high-frequency species and 221 were from low-frequency species.

The acoustic activity of bats during the recording period (mid-late June to early June) averaged 49.73 passes/night at D20, 116.17 passes/night at D21, 7.20 passes/night at D23, 79.92 passes/night at D24 and 21.71 passes/night at D25. This level of activity is lower than that of 2015 and corroborates the idea noted in 2015 that activity may be lower in this area by late June.

2017 Bat Acoustic Surveys

Acoustic bat monitoring during 2017 produced records of five of the six bat species anticipated to be present in the RRM area based on existing data sources: Little Brown Myotis, Big Brown Bat, Silver-Haired Bat, Hoary Bat and Eastern Red Bat. Although no Northern Myotis were identified during this survey year, ambiguous recordings classified as Myotis species may include passes by Northern Myotis as this species is known to occur in the RRM area as it has been recorded in previous survey years (Table 3-4). A total of 9,004 passes were recorded during the maternal brood rearing period (June to early July) over a total of 141 recording nights. Silver-haired Bats were recorded at all five surveys stations with the highest frequency of occurrence (30.4% of the total passes recorded). Little Brown Myotis were also recorded at all five survey locations with a high frequency of occurrence (30.1%; 2,709 passes), with another 3.2% of the total recorded passes being classified as Myotis species (Table 3-4). Hoary Bats and Eastern Red Bats were both recorded at all five survey stations with relatively low frequencies of occurrence of 12.8% and 1.8% of the total recorded passes respectively, while Big Brown Bats were recorded at two survey stations with a low frequency of occurrence (0.06%; 5 passes). Four pairs of species occurred in low frequencies; the combination of Little Brown Bat or Eastern Red Bat had a frequency of 6.4% of the total recorded passes, Silver-haired Bat or Hoary Bat had a frequency of 0.87% of the total recorded passes, Silver-haired Bat or Big Brown Bat had a frequency of 0.14% of the total recorded passes and the combination of Eastern Red Bat or Big Brown Bat had a frequency of 0.01% of the total recorded passes.

A total of 1,061 passes could not be classified to species or species pair; 222 of these were from high-frequency species, 647 were from low-frequency species and 414 could not be classified, likely as a result of poor recording quality.

The acoustic activity of bats during the first recording period (early June to late June) averaged 45.43 passes/night at D20, 634.67 passes/night at D21, 10.07 passes/night at D23, 19.67 passes/night at D24 and 5.53 passes/night at D25. The acoustic activity of bats during the second recording period (late June to mid-July) was higher than the first round and averaged 58.18 passes/night at D20, 95.71 passes/night at D21, 31.20 passes/night at D23, 66.00 passes/night at D24 and 19.38 passes/night at D25 (Table 3-4). Most species occurrences increased in this second survey period, which may indicate a late arrival from

wintering areas. Once again, Little Brown Myotis showed a substantial decrease in activity during the later survey period which corroborates the idea noted in 2015 and 2016 that activity of this species may decrease in this area by late June.

2018 Bat Acoustic Surveys

Acoustic bat monitoring during 2018 was not undertaken with the same methodology as the previous survey years (further details in Section 2.2.1). As such the results cannot be directly compared and should be interpreted with caution. Minimal data of unknown quality was collected during the maternal brood rearing period and an additional full survey program was undertaken in the early fall.

Despite the anomalies in data collection, five of the six bat species anticipated to be present in the RRM area based on existing data sources were detected: Little Brown Myotis, Big Brown Bat, Silver-Haired Bat, Hoary Bat and Eastern Red Bat. Although no Northern Myotis were identified during this survey year, ambiguous recordings classified as Myotis species may include passes by Northern Myotis as this species is known to occur in the RRM area as it has been recorded in previous survey years (Table 3-5).

During the spring survey period a total of 1,825 passes were recorded during the maternal brood rearing period (June to early July) over a total of 65 recording nights. Only three detectors collected data for various recording periods (Table 2-1). No Little Brown Myotis were detected during this survey period. Silver-haired Bats and Hoary Bats were recorded at all three surveys stations with the two highest frequencies of occurrence (57.4% and 15.5% of the total recorded passes). Big Brown Bats and Eastern Red Bats were both recorded at two of the three survey stations with low frequencies of occurrence (0.8% and 0.2% of the total recorded passes, respectively). Five passes (0.3% of the total recorded passes) classified as Myotis species (either Little Brown Myotis or Northern Myotis) were recorded at a single station (Table 3-5).

A total of 472 (25.8%) passes could not be classified to species or species pair; 63 of these were from high-frequency species and 409 were from low-frequency species.

The acoustic activity of bats during the spring recording period (June to July) averaged 14.48 passes/night at D21, 10.11 passes/night at D23 and 157.57 passes/night at D24. Due to the various issues with bat detectors it is unclear whether the low numbers of Myotis species recorded is due to an actual paucity of individuals or due to faults with the recording equipment. Results from the next monitoring year will be key to determining current trends for these species.

During the fall survey period (late August to early September) a total of 12,975 passes were recorded over a total of 132 recording nights. Silver-haired Bats and Hoary Bats were recorded at all five surveys stations with the two highest frequencies of occurrence (60.3% and 20.6% of the total recorded passes, respectively). Eastern Red Bat and Big Brown Bat were also both recorded at all five survey stations with lower frequencies of occurrence (4.1% and 1.8% of the total recorded passes, respectively). Little Brown Myotis were recorded at three of the five survey locations while Myotis species were recorded at four of the five locations and each had a low frequency of occurrence (0.1% of the total recorded passes each; 17 and 13 passes, respectively) (Table 3-5).

A total of 1,690 passes could not be classified to species or species pair; 636 of these were from high-frequency species and 1,054 were from low-frequency species.

The acoustic activity of bats during the fall recording period (late August to early September) averaged 217.15 passes/night at D20, 83.26 passes/night at D21, 97.15 passes/night at D23, 44.73 passes/night at D24 and 139.81 passes/night at D25. Little Brown Myotis and unknown Myotis species were identified among the recorded passes, indicating they were present within the RRM study area during 2018. However, these values do not give an indication of their level of activity during the maternal brood rearing period. This fall survey has recorded the highest number of passes from both Silver-haired and Hoary Bats across all survey years. Silver-haired, Hoary and Eastern Red Bats are migratory species. Migration occurs in the spring and late summer/fall, with this latter period also coinciding with the mating period. Except for the mating period, at all other times of the year, these species are generally solitary so it is therefore not uncommon to see increases in acoustic activity of these species during late summer and fall (Jameson and Willis 2014).

3.2 Bat Species at Risk

In January 2013, the Little Brown Myotis and the Northern Myotis were afforded Endangered Species Status in Ontario and are now protected under the ESA and the federal *Fish and Wildlife Conservation Act, 1997* (FWCA). Since it first appeared in upstate New York in 2006, the fungal disease known as White Nose Syndrome has decimated millions of bats throughout eastern North America and is rapidly spreading westward (Frick et al. 2010). Little Brown Myotis and Northern Myotis are the two species most impacted by White Nose Syndrome (White-Nose Syndrome Response Team 2018). The natural histories of these two species are very similar in that both rely on old growth forest stands where they form maternity colonies in tree cavities. Both also rely on caves and abandoned mines as hibernacula and staging points for reproductive activities (Norquay et al. 2013). This section presents acoustic survey results specific to the two SAR known to occur within the RRM study area.

3.2.1 Little Brown Myotis

Since the Northern Myotis is generally less abundant than the Little Brown Myotis (Caceres and Barclay 2000), the majority of calls classified as Myotis species were likely produced by the Little Brown Myotis.

During spring maternal brood rearing period surveys in 2015 Little Brown Myotis and the Myotis species group made up 52% (7,334 out of 13,958) of all recorded passes, of which 70% of these (5,152 out of 7,334) were at D21 (Table 3-6). In 2016, these species made up less of the overall passes, with 23% (839 out of 3591) of all recorded passes, however, 68% of these (573 out of 839) were again at D21. Similarly, in 2017 these species made up 33% (2,999 out of 9,004) of all recorded passes, and again, 93% of these (2,778 out of 2,999) were at D21. While there appears to be variation in the activity levels of this species between years, the majority of the activity is consistently at Detector D21.

The average activity of the Little Brown Myotis and Myotis group throughout the study area was 52.01 passes/night in 2015, 12.16 passes/night in 2016, 21.27 passes/night in 2017, dropping to 0.08 passes/night in 2018. There appears to be high variability in average number of passes/night between survey years. While this decrease does seem to correspond with the approximate arrival of White Nose Syndrome in the area (White-Nose Syndrome Response Team 2018), the data from 2018 is of relatively questionable quality, so the next round of survey data will be key to predicting ongoing population dynamics for this species.

3.2.2 Northern Myotis

Northern Myotis was recorded in the RRM study area in 2015 and 2016 with a low detection rate. This species was not confidently identifiable to species in 2017 or 2018. This species may have been recorded more often but could not be distinguished from the Little Brown Myotis. Both species commonly produce echolocation calls that are difficult to distinguish from each other and so the Northern Myotis may have been recorded more often and at more locations than could be determined.

During spring maternal brood rearing period surveys in 2015, Northern Myotis made up 0.16% of all recorded passes (22 out of 13958) of which 18% were recorded at D20, 50% at D23, 23% at D24 and 9% at D25 (Table 3-6). In 2016, only two passes were detected, and both were at D23. It is not possible to make broad conclusions with the paucity of data currently available for this species, however, it appears D23 may have slightly higher activity levels of this species in comparison with the other detectors.

Average activity of Northern Myotis throughout the study area was 0.16 passes/night in 2015 and 0.03 passes/night in 2016.

Notes:

Detector failures in 2018 led to minimal data collected during maternal brood rearing period and a later round 2 of collection in early fall, as such passes/night were calculated for each round rather than the entire season.

Notes:

Yellow highlighted squares are those with relatively high values worthy of note. For species with lower frequency of detection (LABO and EPFU) this was considered to be 9 passes/night and for species with high frequency of detection (LACI and LANO) this was considered to be > 30 passes/night.

Four letter codes are derived from scientific names; LABO = Eastern Red Bat, LACI = Hoary Bat, LANO = Silver-haired Bat, EPFU = Big Brown Bat.

4.0 Discussion

4.1 Species at Risk

Little Brown Myotis

The Little Brown Myotis is designated as Endangered under both the ESA and SARA. Ontario's ESA prohibits harming, destroying or disturbing habitat for this species under Sections 9 and 10 of the Act. The Little Brown Myotis is at risk of population decline due to their low reproduction rates, communal hibernating behaviour and recent declines due to White Nose Syndrome, a fungal infection that has been devastating bat populations across eastern North America. More information about White Nose Syndrome is provided in Section 4.5.

Little Brown Myotis roost in small spaces or crevices found in loose bark, hollow trees, rock faces and human structures such as walls and bat boxes. Colony numbers may range from a few to a few hundred individuals (Ministry of Natural Resources [MNR] 2011, Environment and Climate Change Canada [ECCC] 2018). This species forages over open areas such as water, forest trails and meadows. During the winter months the Little Brown Myotis will hibernate in caves and abandoned mines shafts, underground foundations and karst (MNR 2011, ECCC 2018). Hibernacula sites are characterized by remote and restricted openings with sufficient space for entry and with interior air temperatures slightly above freezing, relative humidity levels above 90% and sufficient space for roosting (Raesly and Gates 1987, MNR 2000, ECCC 2018).

Little Brown Myotis was recorded at all five survey locations within the RRM study area at high levels, particularly in 2015 and 2017 (Table 3-6). In 2015 35% of all passes were by Little Brown Myotis with an additional 17% by Myotis species (4,921 and 2,413 passes, respectively). In 2017, 30% of all passes were by Little Brown Myotis with an additional 4% by Myotis species (2,709 and 290 passes, respectively).

Little Brown Myotis and Myotis species passes appear to have a consistently high detection rate at Detector 21 (Table 3-7). In 2015, detections of these species at D21 made up 70% of their overall detections and in 2017 this value increased to 93%. Despite the 2016 survey period having a smaller sample size for these species, 68% of their overall detections were at D21.

Detector 21 is situated beside the Pinewood River with agriculture to the north and forest to the south of the river. During 2013 vegetation and habitat assessments for bat critical habitat no maternity roost sites were identified and no habitat meeting the Ministry of Natural Resources and Forestry (MNRF) criteria for significant bat habitat was detected around the RRM site (AMEC 2013). However, with the high levels of activity and detection rates at Detector 21 it is possible a maternity roost is located in the adjacent forest habitat and further bat habitat surveys should be considered.

There is not enough repetition in survey periods yet to indicate clear trends. However, it appears that Little Brown Myotis and Myotis species show higher activity levels in earlier sampling periods (beginning in early June). In 2015 and 2017 when two rounds of surveys were undertaken, the second round in both years had lower numbers of Little Brown Myotis and Myotis detections. While only one survey was undertaken in 2016, it was completed later in June than surveys completed in 2015 and 2017 (Table 2-1). While it could be at least partly a yearly effect, the levels of Little Brown Myotis and Myotis activity were lower in this survey than they had been for those performed earlier in 2015 and 2017.

Northern Myotis

The Northern Myotis is designated as Endangered under both the ESA and SARA. Ontario's ESA prohibits harming, destroying or disturbing habitat for this species under Sections 9 and 10 of the Act. The Northern Myotis is at risk of population decline due to their low reproduction rates, communal hibernating behaviour and recent declines due to White Nose Syndrome, discussed below in Section 4.5.

The habitat requirements of the Northern Myotis are similar to those of the Little Brown Myotis. The Northern Myotis is also a cavity roosting bat species that resides year-round in Ontario. Roost sites include small spaces or crevices found in loose bark, hollow trees, rock faces and human structures such as walls and bat boxes. Northern Myotis roost singly or in small groups (ECCC 2018). This species forages along and within forests including forested stream corridors. During the winter months the Northern Myotis will hibernate in caves and abandoned mines shafts, underground foundations and karst (MNR 2011, ECCC 2018). Hibernacula sites are characterized by remote and restricted openings with sufficient space for entry and with interior air temperatures slightly above freezing, relative humidity levels above 90% and sufficient space for roosting (Raesly and Gates 1987, MNR 2000, ECCC 2018).

Northern Myotis was recorded in 2015 and 2016 with a low detection rate and no Northern Myotis were specifically identified in 2017 or 2018 (Table 3-6). Since the recordings of Northern Myotis are difficult to distinguish from Little Brown Myotis, identification of this species may have been underrepresented. The presence of calls classified to genus (Myotis species) suggests it is possible that Northern Myotis may be present at higher levels than currently reported within the study area.

Northern Myotis have been detected at four of the five survey stations, indicating the population may be widespread though at very low numbers. During spring maternal brood rearing period surveys Northern Myotis made up 0.16% and 0.06% of all recorded passes in 2015 and 2016 respectively. Within the passes recorded for this species, 50% of the detections were at Detector 23 in 2015 and 100% (2 passes) were at D23 in 2016. It appears D23 may have slightly higher activity levels of this species than the other detector locations (Table 3-7). However, further data are required to confirm this apparent trend.

Detector 23 is situated in a wooded area with rock barren habitat, forest clearings, trails, and roads present in close proximity. These habitats provide ample preferred foraging habitat for this species. During the 2013 vegetation and habitat assessments for bat critical habitat, no maternity roost sites or hibernacula were identified and no habitat meeting the MNRF criteria for significant bat habitat was detected around the RRM site and nearby compensatory habitats (AMEC 2013). The low levels of activity and detection rates of this species indicate that while it may be using some of these nearby habitats to carry out its life processes, it is unlikely that critical habitat is present within the RRM site.

4.2 Non-Species at Risk

Some interesting patterns were observed in the data across the survey years. As stated in Section 4.1, Detector 21 appeared to have consistently high activity levels of Little Brown Myotis. The same pattern was present for Silver-haired Bat with the highest passes/night for this species, in each maternal brood rearing survey period, recorded at this detector (Table 3-8). The highest passes/night for Eastern Red Bat across the study, recorded in 2015, were recorded at this survey location. As suggested for Little Brown Myotis, further bat habitat surveys should be considered in the forest habitat adjacent to this survey location.

Due to the issues with the acoustic surveys during the maternal brood rearing period in 2018, a unique survey was undertaken in early fall (late August to early September). The activity levels for several non-SAR bat species were detected at the highest levels for the entire study during this survey period. Silver-haired Bat detections were high at every detector location (Table 3-9) during this survey period and Detector 25 had the highest passes/night of the entire study for Eastern Red Bat, Hoary Bat, Big Brown Bat and the second highest passes/night for Silver-haired Bat. Silver-haired, Hoary and Eastern Red Bats are migratory species. Migration occurs in the spring and late summer and fall, with this latter period also coinciding with the mating period. Except for the mating period, at all other times of the year, these species are generally solitary, therefore it is not uncommon to see increases in acoustic activity of these species during late summer and fall (Jameson and Willis 2014). Detector 25 is on the edge of a large wetland complex and may represent an ideal foraging site for migrating bats. Migratory species rely on large trees for roosting and potentially as landmarks for mating (Jameson and Willis 2014). However, the 2013 vegetation and habitat assessments for bat critical habitat found no habitat meeting the MNRF criteria for significant bat habitat around the RRM site and nearby compensatory habitats (AME 2013) which supports the hypothesis that the area at D25 may serve more as a foraging stop-over site.

4.3 Results Relative to 2012 and 2013 Data

The 2012 and 2013 detectors were deployed in different locations to the detectors in 2015 through 2018. Additionally, survey periods were much shorter (5 nights) which can cause species with low detection levels to be missed or misrepresented. As such, direct comparisons are not recommended with the current analysis. These early acoustic surveys coupled with habitat assessments are considered a pilot run to determine the best locations for long term bat acoustic monitoring.

Species presence/absence, as well as relative detection levels from the current analysis are consistent with the results obtained from the 2012 and 2013 surveys periods. The 2012 survey period recorded five of the six species, with Big Brown Bat not confirmed to the species level. The 2013 survey period likewise recorded five of the six species, with Eastern Red Bat not confirmed to the species level.

Little Brown Myotis and Silver-haired Bat have been consistently detected at the highest frequencies of occurrence and widest distributions followed by Hoary Bat. Eastern Red Bat and Big Brown Bat are widespread and have been consistently detected at relatively low frequencies of occurrence while Northern Myotis has the lowest level of detection and the smallest consistent distribution.

Average activity of the Little Brown Myotis and Myotis group can be compared across the study area; in 2012 these species averaged 11.9 passes/night, in 2013 10.4 passes/night, in 2015 this value escalated to 52.0 passes/night, in 2016 5.5 passes/night, in 2017 19.21 passes/night and only 0.08 passes/night in 2018. The high degree of variability in species occurrences may be explained by multiple factors and/or combinations thereof, such as: actual population fluctuations, the arrival of White Nose Syndrome in the area in 2017/2018, weather during survey periods, various errors during detector deployment, equipment sensitivity, and/or the timing of surveys.

4.4 Critical Habitat

The RRM Final EA Report (AMEC 2014) estimated that approximately 2,170 hectares (ha) of terrestrial habitat would be directly impacted by RRM. A total of 1,352 ha of woodland habitat will be cleared, of which 1,090 ha comprise second-growth aspen-birch hardwood forest, the dominant forest community type in the NLSA. This older deciduous or mixed wood habitat type can also potentially support bat maternal roost colonies and foraging habitat for local bat species including two SAR. In addition,

approximately 261 ha of open wetland habitat and other habitats potentially used as foraging habitat will be directly impacted.

During the spring and early summer, most Ontario bat species rely on forest habitat, typically mature (dominant trees over 80 years old) deciduous or mixed stands, that support a healthy density of large-diameter cavity trees. Little Brown Myotis, Northern Myotis, Silver-haired Bat and Big Brown Bat utilize maternity roosts consisting of cavities or crevices provided by loose bark, hollow trees, woodpecker holes and rock faces, whereas Eastern Red Bat and Hoary Bat are foliage-roosting species (Fenton 1970, MNR 2011). Preferred roost trees of forest-dwelling bats are generally in early stages of decay, but may be alive, are relatively tall with large trunks, are situated in areas of low density canopy and are in proximity to other suitable roost trees (Kunz and Lumsden 2003). Females form maternity colonies of single individuals to hundreds of individuals in cavities that provide a warm, humid microclimate that optimizes gestation and growth of offspring (Kunz and Anthony, 1982).

In August and September, bats congregate at the entrance of caves or mine shafts which are used as hibernacula during the winter (Norquay et al. 2013). Hibernacula sites are characterized by remote and restricted openings with sufficient space for entry and with interior air temperatures slightly above freezing, consistent air flow, relative humidity levels above 90% and sufficient space for roosting (Raesly and Gates 1987, MNR 2000, ECCC 2018).

Thorough vegetation and habitat surveys undertaken in 2013 did not identify any maternity roost or hibernacula sites within the NLSA and nearby compensatory properties.

The density of potential maternity roosting trees in forest stands impacted by the RRM footprint ranged from 0 to 6.67 trees per ha (trees/ha) with an average of 3.6 trees/ha. The density of candidate roost trees in forest stands within prospective compensatory properties near the RRM ranged from 0 trees/ha to 8.9 trees/ha with an average of 5.2 trees/ha. Both values are below the 10 trees/ha minimum threshold specified by the MNR (MNR 2011) for identifying candidate significant bat maternity roosting habitat. Therefore, areas impacted by project activities and those in nearby compensatory properties do not contain significant maternity roosting habitat for bats, particularly of the genus Myotis.

Six areas of exposed bedrock were thoroughly examined, and none contained features such as cracks, crevices or other openings that might provide suitable habitat for hibernation. Rock piles at these sites were also unsuitable. No abandoned mines occurred near or within the RRM.

While no areas met the criteria of candidate bat maternity roost habitat or hibernacula, the detection of bats within the study area indicates several species are utilizing the habitats within the study area to carry out their life processes. The relatively high levels of activity observed in certain locations and at certain times of year as described in Sections 4.1 and 4.2 above may indicate these critical habitats are present and undetected. Future acoustic programs and bat habitat assessment could be considered as described above.

4.5 White Nose Syndrome

Little Brown Myotis and Northern Myotis species have recently experienced dramatic population declines in Ontario and across northeastern North America due to White Nose Syndrome. White Nose Syndrome is a fungus which grows optimally in the same conditions under which bats hibernate and has killed up to 99% of bats in infected hibernacula (Frick et al. 2010). White Nose Syndrome grows on the muzzle, ears and wings of hibernating bats and spreads quickly between hibernating bats which huddle together to

thermoregulate during the winter. In doing so, infected individuals may pass the fungus to neighbouring bats. White Nose Syndrome causes bats to prematurely arouse from torpor (hibernation) in the winter and subsequently, leads to death from starvation due to excessive activity without a readily available food source (MNR 2011).

5.0 Conclusion

Acoustic monitoring has consistently recorded all six species of bat anticipated to be present, based on current known ranges. These species are: Little Brown Myotis, Northern Myotis, Eastern Red Bat, Silver-Haired Bat, Hoary Bat and Big Brown Bat. The Little Brown Myotis and Northern Myotis are both designated as Endangered Species protected under Ontario's ESA, which prohibits harming, destroying or disturbing habitat for these species under Sections 9 and 10 of the Act.

Detection levels for all species are variable though some patterns are apparent. Little Brown Myotis and Silver-haired Bats have been consistently detected at the highest frequencies of occurrence and widest distributions, followed by Hoary Bat. Eastern Red Bat and Big Brown Bat are widespread and have been consistently detected at relatively low frequencies of occurrence, while Northern Myotis has the lowest level of detection and the smallest consistent distribution.

Northern Myotis was recorded in 2015 and 2016, although with a low detection rate, and this species was not confidently identifiable to species in 2017 or 2018. Since the recordings of Northern Myotis are difficult to distinguish from Little Brown Myotis, identification of this species may have been underrepresented. The presence of calls classified to genus (Myotis species) suggests it is possible that Northern Myotis may be present at higher levels than currently reported within the study area. During spring maternal brood rearing period surveys Northern Myotis made up 0.16% and 0.06% of all recorded passes in 2015 and 2016, respectively. Within the passes recorded for this species, 50% of the detections were at D23 in 2015 and 100% (2 passes) were at D23 in 2016. While it is not possible to confirm apparent trends with the level of data currently collected, it appears D23 may have slightly higher activity levels of this species than the other detector locations.

Little Brown Myotis was frequently recorded at all five survey locations within the RRM study area at relatively high levels, particularly in 2015 and 2017. In 2015, 52% of the total passes recorded were by Little Brown Myotis or Myotis species and in 2017 these species represented 34% of all passes.

Little Brown Myotis and Myotis species passes appear to have a consistently high detection rate at Detector D21. Between 2015 and 2017 detections of these species at D21 made up 68% to 93% of their overall detections. The same pattern was present for Silver-haired Bat, where D21 consistently recorded the highest passes/night for this species throughout all of the survey periods.

Due to the issues with the acoustic surveys during the maternal brood rearing period in 2018, a unique survey was undertaken in early fall (late August to early September). Interestingly, activity levels for several non-SAR bat species were recorded at their highest levels for the entire study area during this survey period. Silver-haired Bat detections were relatively high at every detector location during this survey period and Detector 25 had the highest passes/night of the entire study for Eastern Red Bat, Hoary Bat, Big Brown Bat. Detector 25 is on the edge of a large wetland complex and may represent an ideal foraging stop-over site for migrating bats.

Most of Ontario's bats, including the two SAR, Little Brown Myotis and Northern Myotis, use mature forests with a high density of large diameter cavity trees as maternity colonies (MNR 2011). Use of maternity colony stands generally occurs between June and July, thus tree clearing of potential bat habitat should be undertaken outside of this period to avoid harming or disrupting roosting bats. If tree clearing must be undertaken between the months of May and August, consultation with the MNRF should be undertaken prior to clearing activities to confirm other seasonal restrictions (such as the breeding bird season) and surveys should be undertaken to confirm the presence of significant roosting habitat. Should

roosting colonies be located within these areas, consultation with the MNRF and ECCC will be required to establish whether clearing activities may continue, whether SAR permitting is required and whether habitat compensation will be required.

During thorough vegetation surveys and bat habitat assessments in 2013 no candidate maternity roosting habitat or hibernacula were identified. However, acoustic surveys demonstrate that these species are consistently active, with some species having relatively high activity levels within the RRM study area. This suggests that at least some roosts or other critical habitat may be present nearby.

Bat Acoustic Analysis Sample

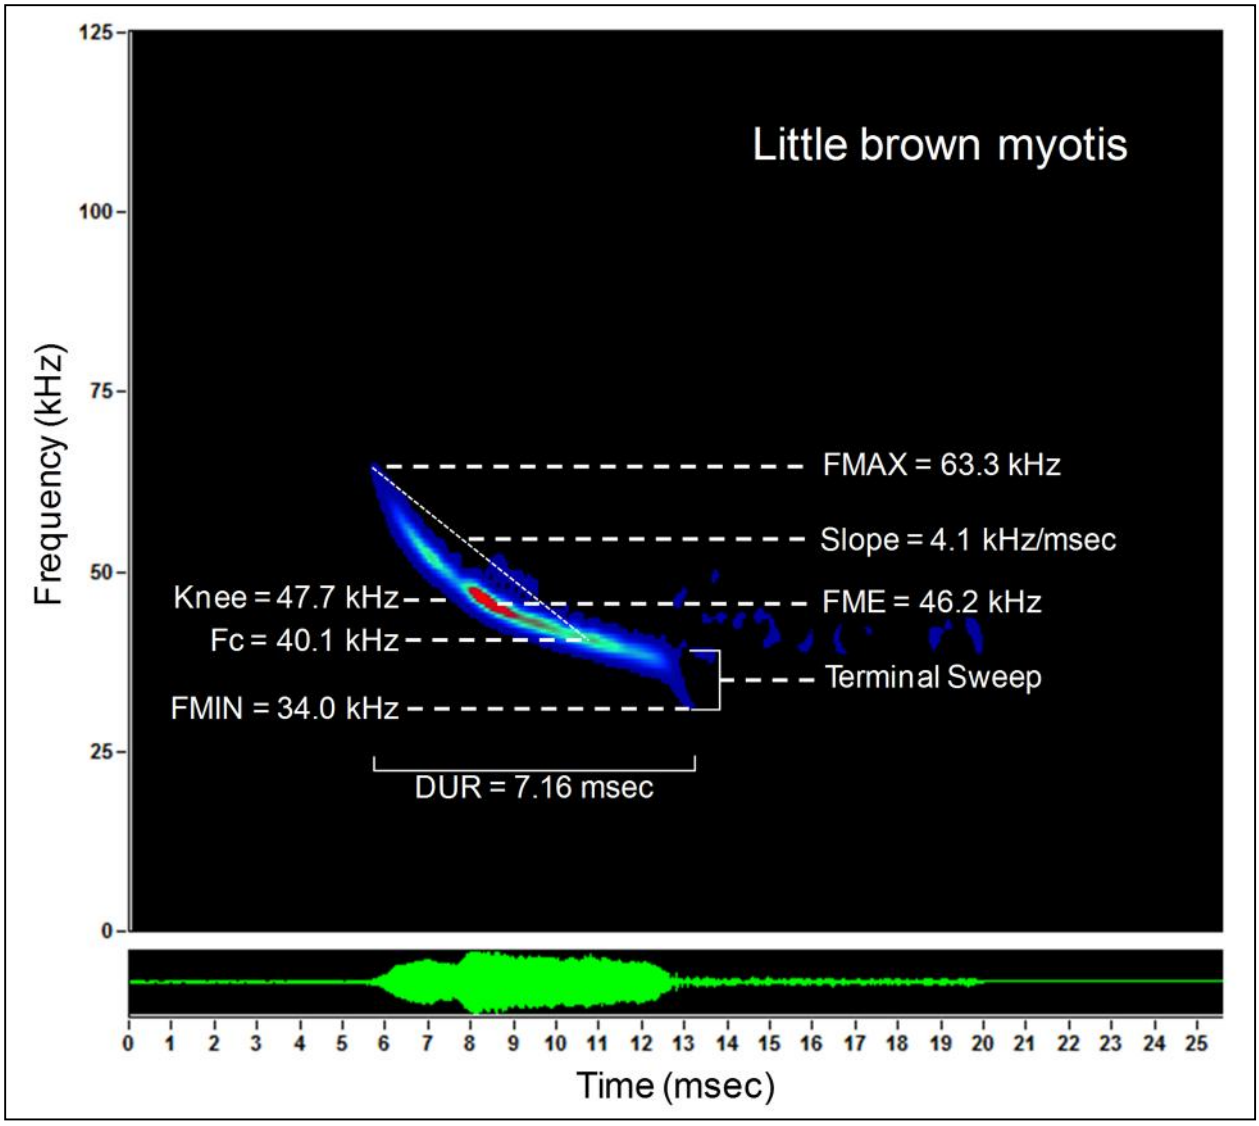

Figure 1: Spectrogram (above) and oscillogram (below) of a search-phase echolocation pulse from a Little Brown Myotis (Myotis lucifugus). Parameters displayed are those used to identify which species emitted the call: FMAX = Maximum frequency, FMIN = Minimum frequency, FME = Frequency with maximum energy, Knee = Frequency of most abrupt change in slope, Fc = Main frequency at the end of the call, DUR = Duration.

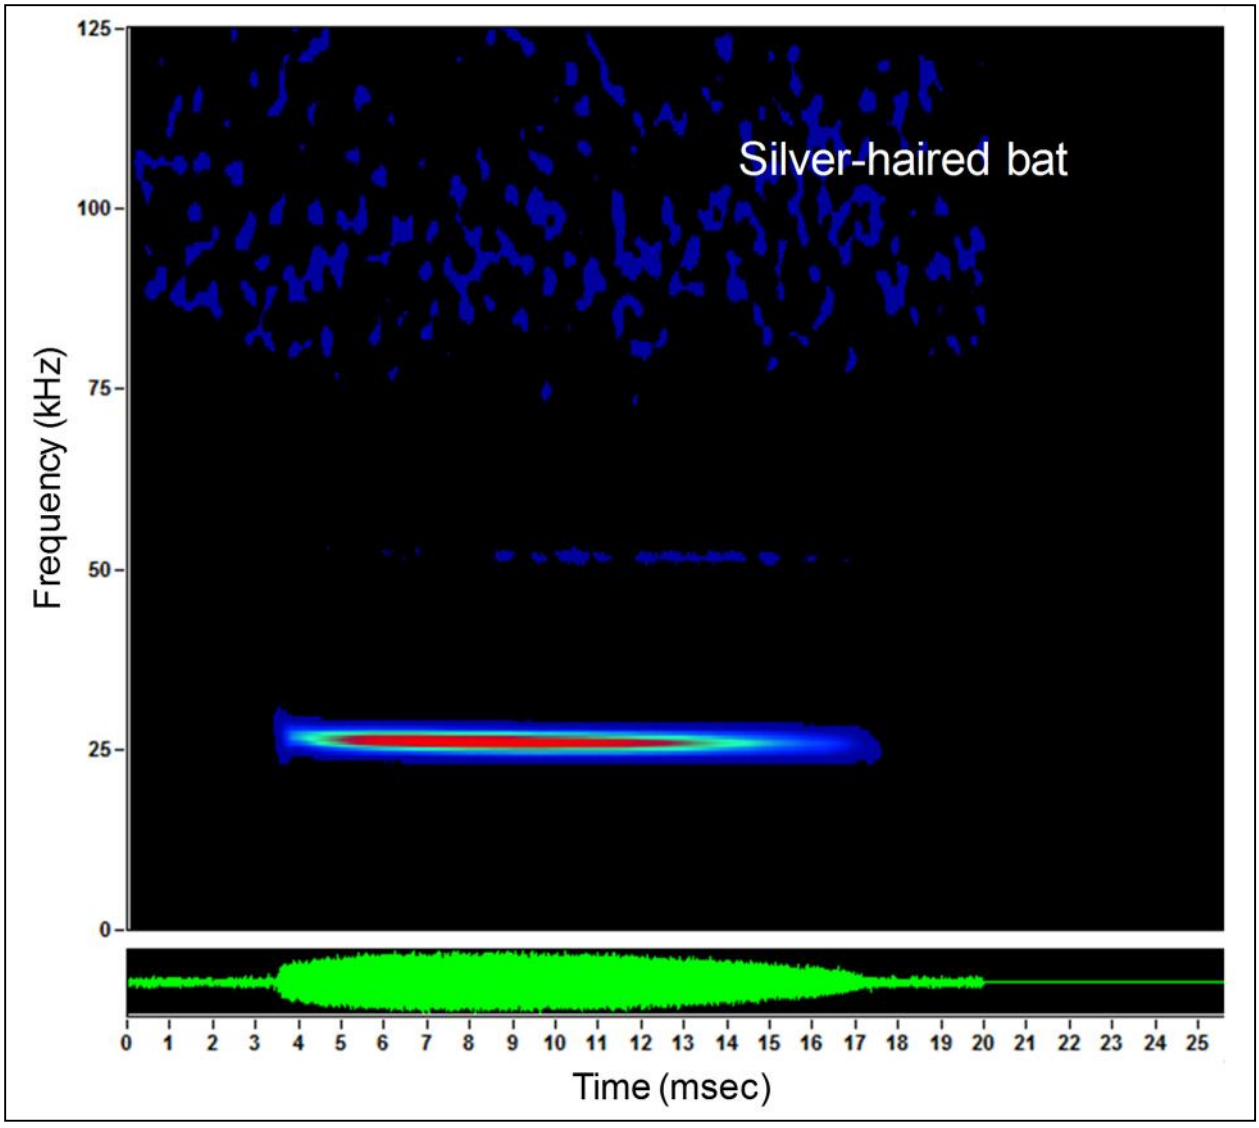

Figure 2: Spectrogram (above) and oscillogram (below) of a search-phase (constant frequency variant) echolocation pulse from a Silver-haired Bat (Lasionycteris noctivagans).

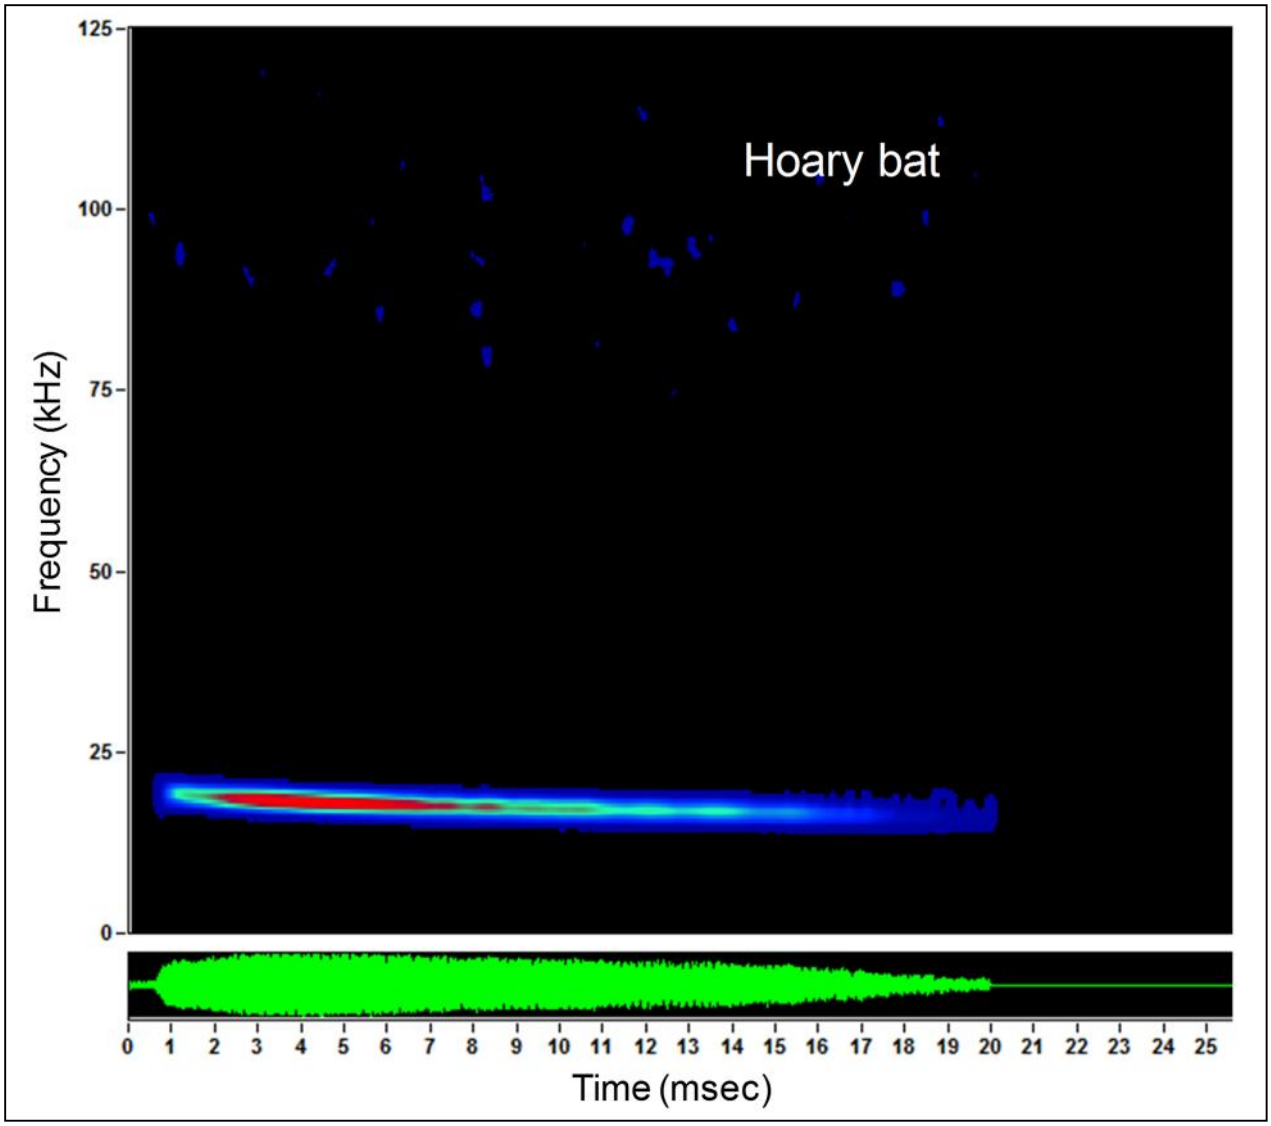

Figure 3: Spectrogram (above) and oscillogram (below) of a search-phase echolocation pulse from a Hoary Bat (Lasiurus cinereus).

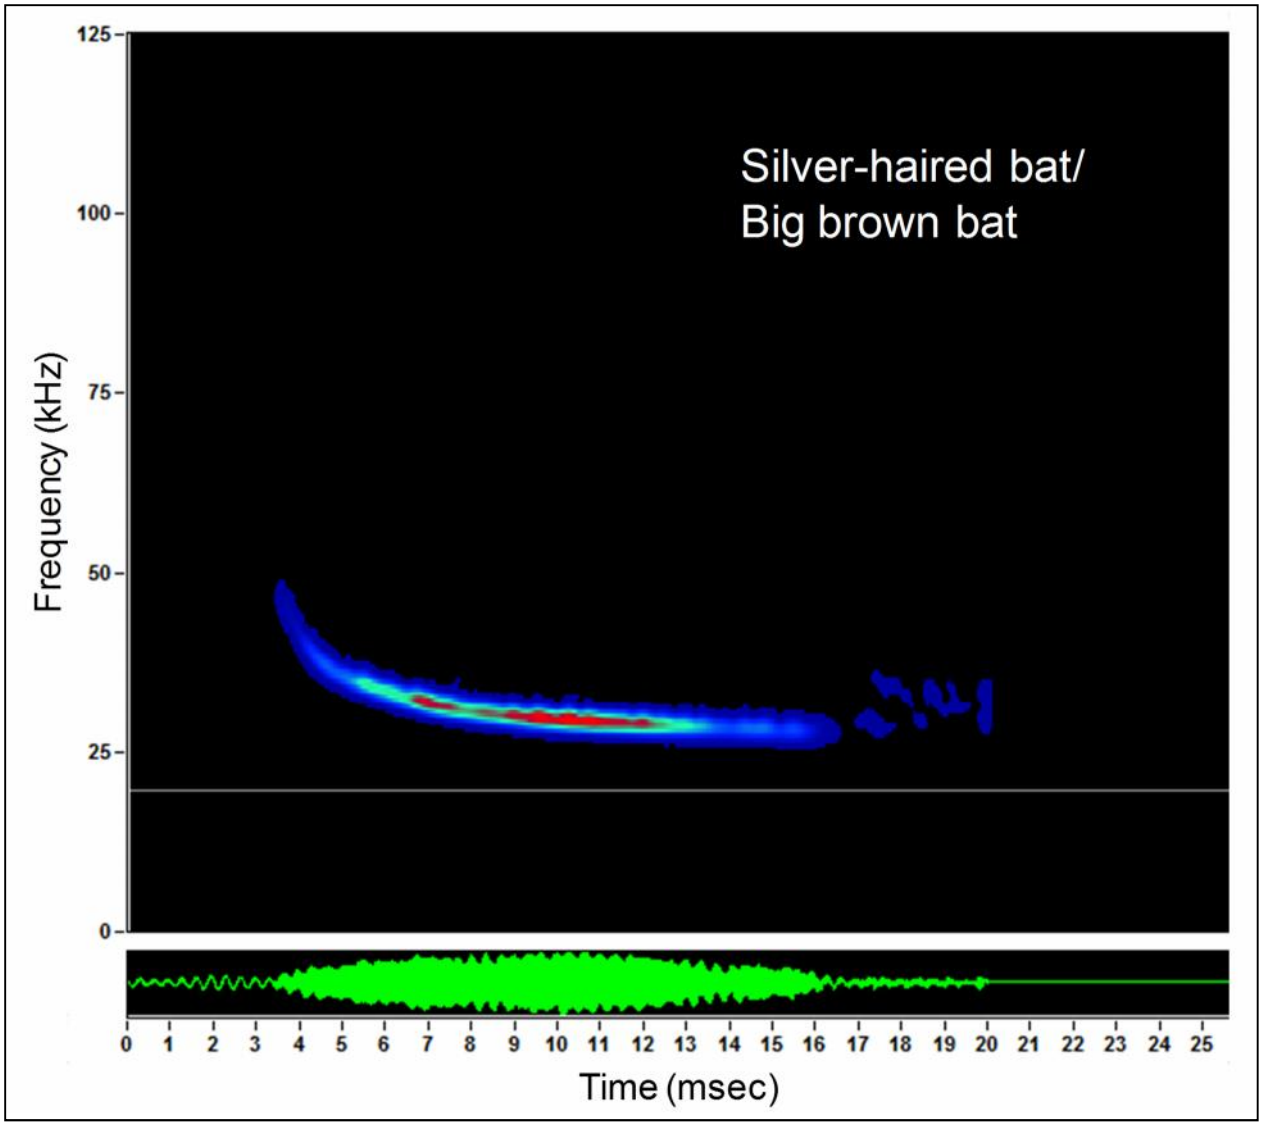

Figure 4: Spectrogram (above) and oscillogram (below) of a search-phase echolocation pulse from either a Silver-haired Bat (Lasionycteris noctivagans) or a Big Brown Bat (Eptesicus fuscus). These two species produce certain variants of echolocation that are similar to each other. This often makes it nearly impossible to accurately distinguish between these species using echolocation.

Appendix B

Microphone Sensitivity Report

Bat Detector Pair Testing in 2016

In 2016 microphone sensitivity was found to be extremely variable during routine calibration testing; likely due to the age of the microphones and different weathering conditions attained through use in previous seasons. In an attempt to determine qualitative differences in detectability bat detectors were 'paired' at the RRM in 2016 to allow a comparison of recorded data. This involved deploying two bat detectors at each location, one with a known 'good condition' microphone with a high sensitivity (< -17 dB) with a known 'poor condition' microphone with lower sensitivity (>19 dB).

As shown in the table below the qualitative differences in detectability are quite variable. A microphone pairing that had a 50.30% decrease in sensitivity resulted in an increase of 10.19% passes recorded while another pairing with a 38.78% decrease in sensitivity resulted in a 62.46% reduction in passes recorded.

There are other factors which could be influencing this variability such as recording environment, background noise, microphone positioning, the quality and distance from the source sound and whether there is a clear path between the source and the microphone.

High microphone sensitivity is clearly integral to the quality of data produced however there appears to be high variability in this relationship. This variability makes setting an acceptable sensitivity threshold difficult and implications may need to be addressed on a case by case basis.

Table 1: Appendix Microphone Sensitivity Data

Detector ID	Microphone Condition1	Microphone Sensitivity (dB)	MYLU	MYSE	Myotis	MYLU / LABO	LABO	HiF Species	LACI	LANO	EPFU	LANO / EPFU	LoF Species	UNKN	Total Passes	Passes / Night

Notes:

Positive differences for unidentified species (HiF, LoF, Unknown or combinations e.g., MYLU / LABO) for microphone with poor sensitivity could indicate these calls were able to be identified to the species level with good quality microphone.

Four letter codes are derived from scientific names; combinations refer to passes with characteristics from both species.

HiF = high-frequency bat species
LoF = low-frequency bat species
MYLU = Little Brown Myotis
LABO = Eastern Red Bat
LACI = Hoary Bat
LANO = Silver-haired Bat
EPFU = Big Brown Bat
MYLU/LABO = Little Brown Myotis or Eastern Red Bat
LANO/EPFU = Silver-haired Bat or Big Brown Bat.

Re:	**Rainy River Cover System Field Trial – 2017 – 2019 Factual Data Report**

New Gold Inc. (New Gold) retained the services of O'Kane Consultants Inc. (OKC) to provide engineering and field support for development, instrumentation and performance monitoring of the potentially acid generating (PAG) mine rock cover system field trial at New Golds' Rainy River Mine. This memorandum provides a summary of field data collected from the cover system field trial between October 2017 and February 2019.

PAG Cover System Trials Background:

The PAG cover system field trial consists of two instrumented cover systems which were constructed in October 2017. Trial #1 consists of 0.5 m compacted Brenna clay (CBC), 0.75 m non-compacted clay overburden, and 0.25 m topsoil. Trial #2 consists of 0.5 m CBC and 1 m non-compacted clay overburden. The constructed field trial has an approximate area of 65 m x 100 m with a 1 to 2% sloping plateau of ~3,000 m^2. The main objectives of the cover systems are to:

- Evaluate overburden clay as cover material for mitigation of oxygen ingress during stockpile construction (operations);
- Evaluate overburden clay as a compacted layer within the closure cover system for mitigation of oxygen ingress and net percolation (closure); and
- Develop conceptual models of performance for the cover system field trial area through examining changes in *in situ* gas concentrations after cover system placement and water balances (e.g., precipitation, runoff, evaporation, water storage, etc.).

Each field trial configuration was outfitted with two instrumentation nests (primary and secondary). A meteorological station was installed on Trial #2 to collect local precipitation and net radiation data on the plateau of the trial. *In situ* monitoring instrumentation installed at each field trial includes:

- Eleven (11) matrix suction sensors (CSI 229) to measure suction and *in situ* soil temperature;
- Fourteen (14) water content sensors (CS 616) to measure *in situ* volumetric water content; and
- Six (6) oxygen sensors (SO 110) to measure differential oxygen concentrations above and below the CBC.

Automated data collection has been on-going since commissioning of the data acquisition system (DAS) in June 2018.

***In Situ* Instrumentation Data:**

Instrumentation data obtained from each cover system includes *in situ* volumetric water content and soil temperature throughout the cover system profile, and oxygen concentrations above and below the CBC. This data can be further analysed to investigate the performance of each cover system. This section presents the results of the data analysis, while data measurements obtained directly from *in situ* instrumentation are presented in Attachment A. The top of each cover system was selected as origin datum for all instrumentation depths.

Volumetric Water Content:

Volumetric water content was measured throughout the profile of each cover system to observe changes in the degree of saturation of the CBC. In order to successfully mitigate the ingress of oxygen into the underlying waste rock, the CBC must remain at / near saturated levels. As the degree of saturation exceeds 80%, the diffusion coefficient decreases by several orders of magnitude. A general rule of thumb indicates that maintaining a consistent degree of saturation of 85% or greater within a compacted clay layer will effectively limit the amount of oxygen movement by diffusion[1]. Figures 1 through 4 present the observed change in the degree of saturation with time through the cover system profiles. Table 1 highlights the key findings of saturation levels of the CBC

Table 1: Degree of saturation of the CBC.

	Degree of Saturation		
	Maximum	**Minimum**	**Average**
Trial #1 Primary Nest	100%	92%	96%
Trial #1 Secondary Nest	99%	93%	96%
Trial #2 Primary Nest	100%	83%	96%
Trial #2 Secondary Nest	99%	79%	92%

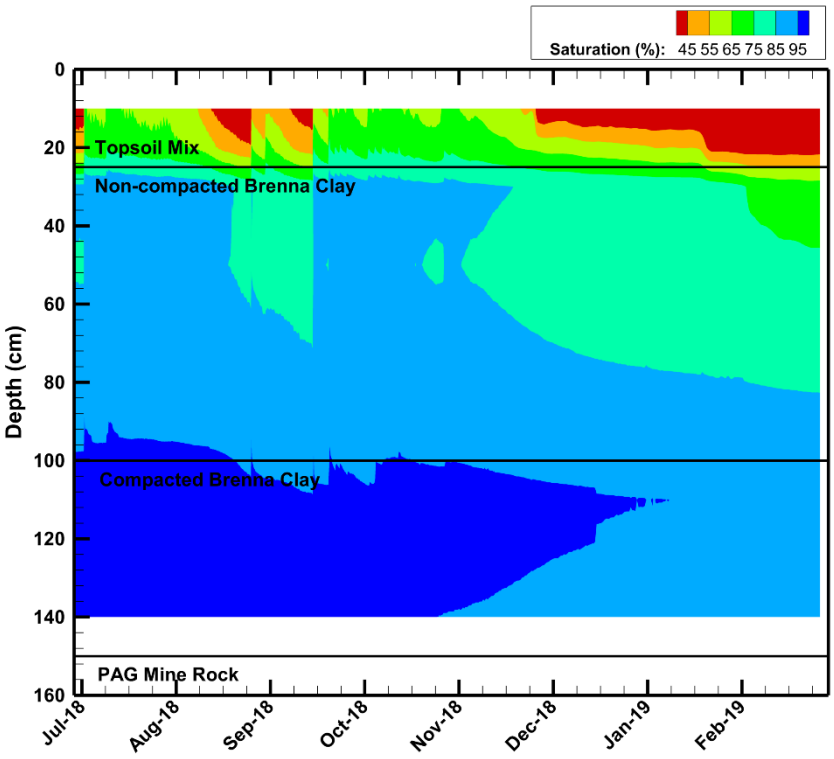

Figure 1: Change in degree of saturation at Trial #1 Primary Nest.

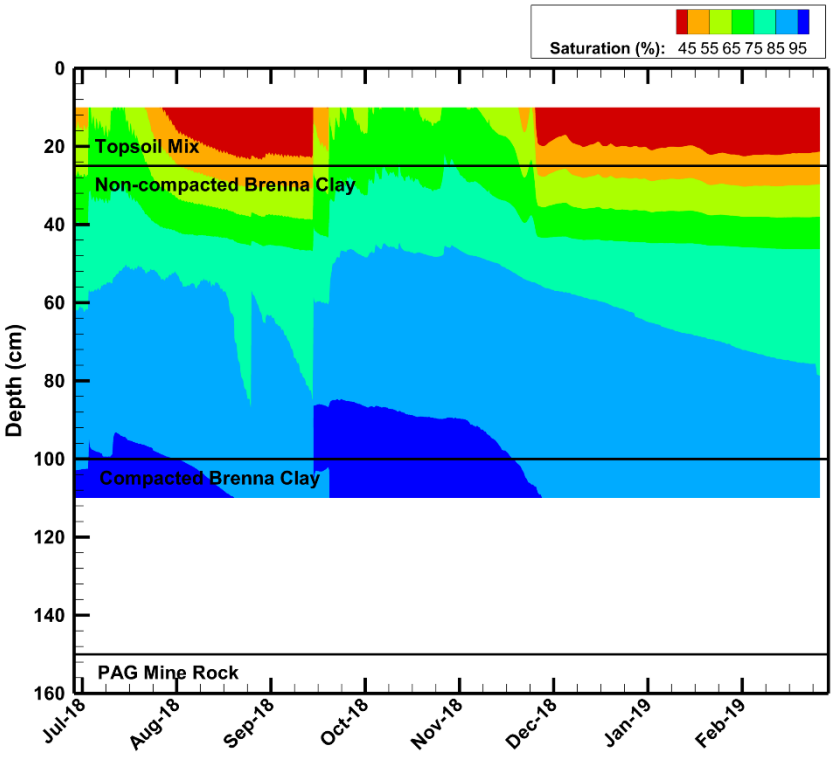

Figure 2: Change in degree of saturation at Trial #1 Secondary Nest.

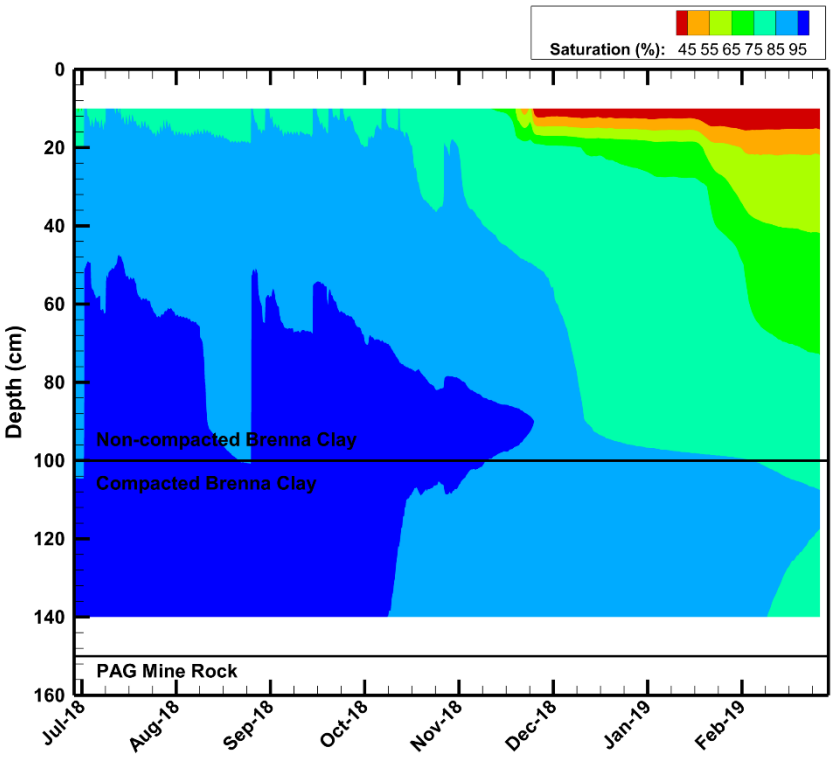

Figure 3: Change in degree of saturation at Trial #2 Primary Nest.

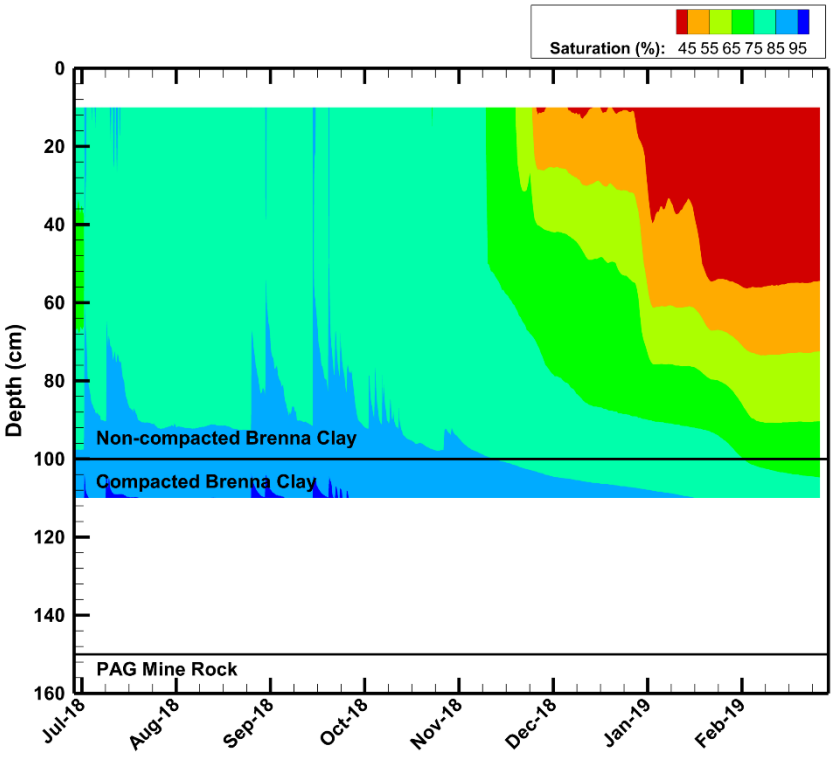

Figure 4: Change in degree of saturation at Trial #2 Secondary Nest.

In Situ Soil Temperature:

In situ soil temperature was monitored over the entire cover system of Trial #1 and Trail #2. *In situ* soil temperature is monitored to determine if the CBC undergoes freeze-thaw cycling. The biggest implication of a freeze-thaw cycle on the CBC is potential changes to physical characteristics (e.g., altering the hydraulic conductivity or moisture retention causing how the degree of saturation is managed. Freezing temperatures were observed in both cover systems starting November 25, 2018. Currently, based on *in situ* temperature measurements presented in Attachment A, the maximum freezing depth is 30 cm and 110 cm for Trial #1 and Trial #2, respectively. The large difference between the observed freezing regime is attributed to the deeper snow pack on Trial #1 (see snow survey for details). The deep snow pack provided an insulating layer between the cover system and ambient air temperature which limits the depth of freezing in the cover system. While Trial #2 had little snow pack (i.e., less insulation) this resulted in the CBC freezing to a greater depth. Figures 5 through 8 illustrate the change in *in situ* soil temperature with time through the trial profiles.

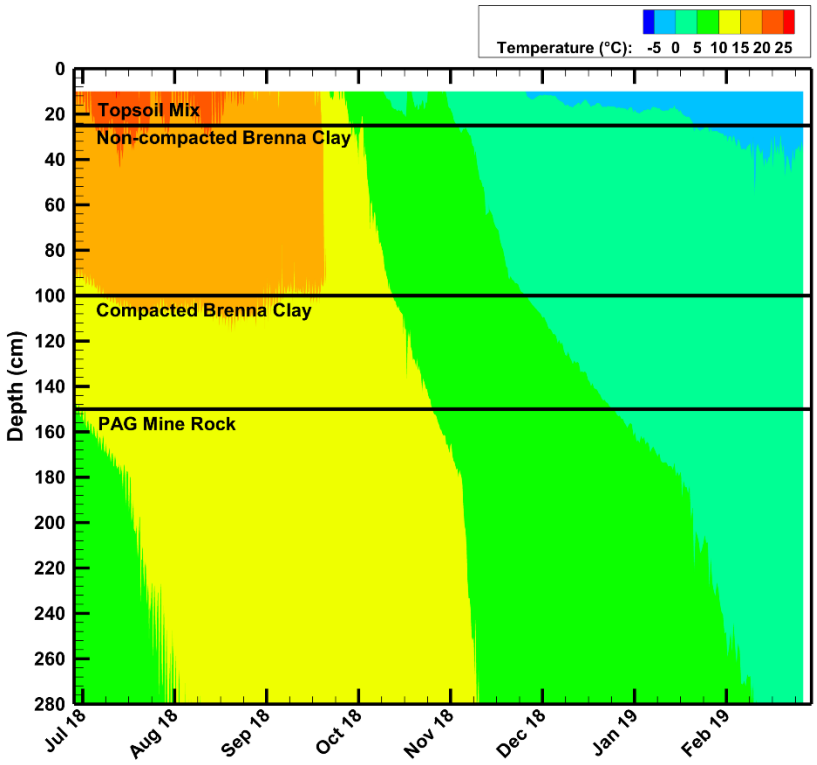

Figure 5: *In situ* soil temperature profile measured at Trial #1 Primary Nest.

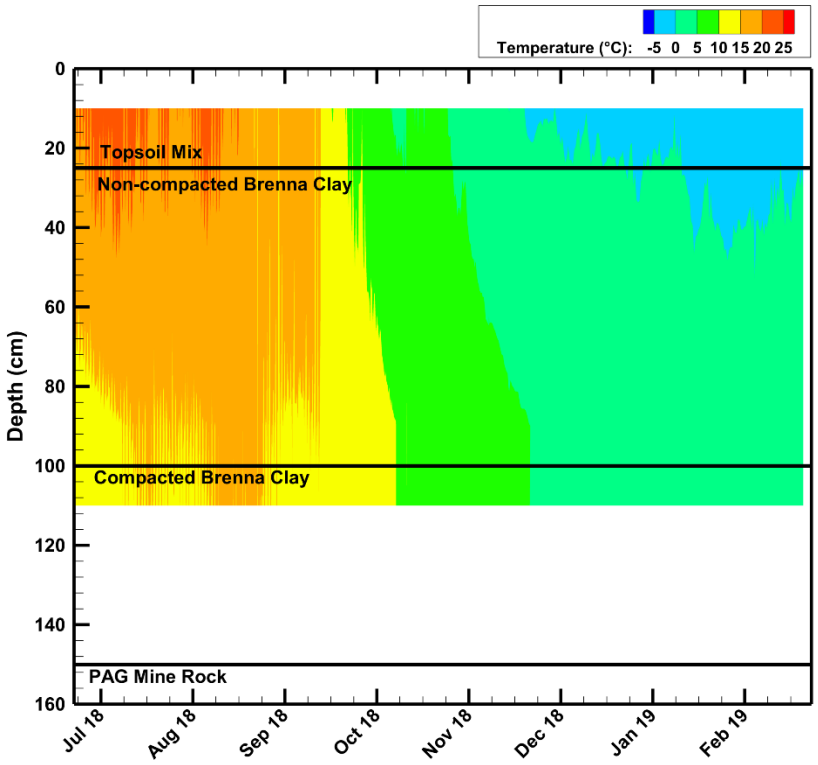

Figure 6: *In situ* soil temperature profile measured at Trial #1 Secondary Nest.

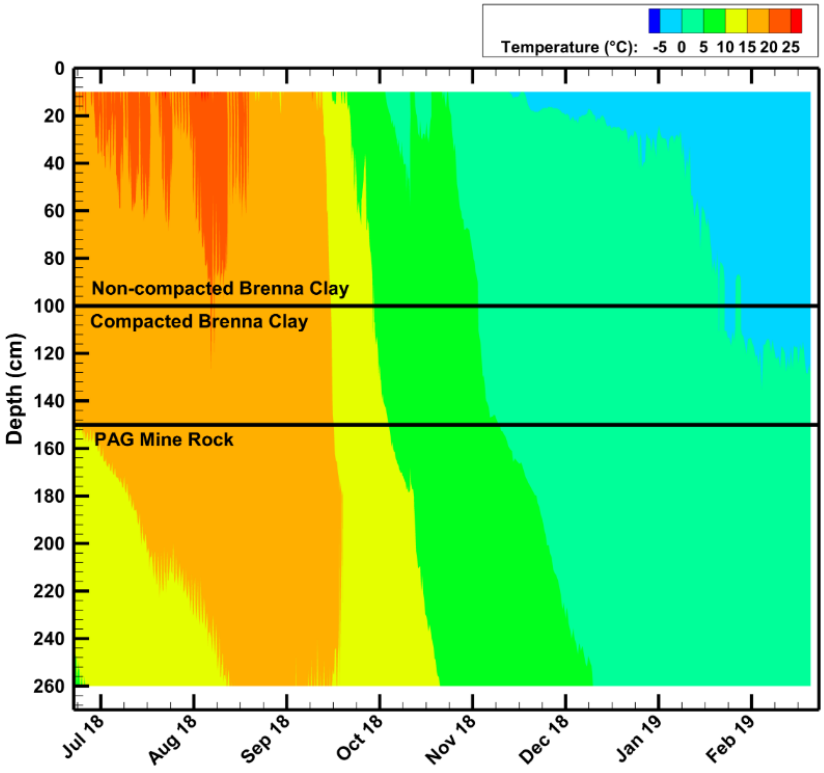

Figure 7: *In situ* soil temperature profile measured at Trial #2 Primary Nest.

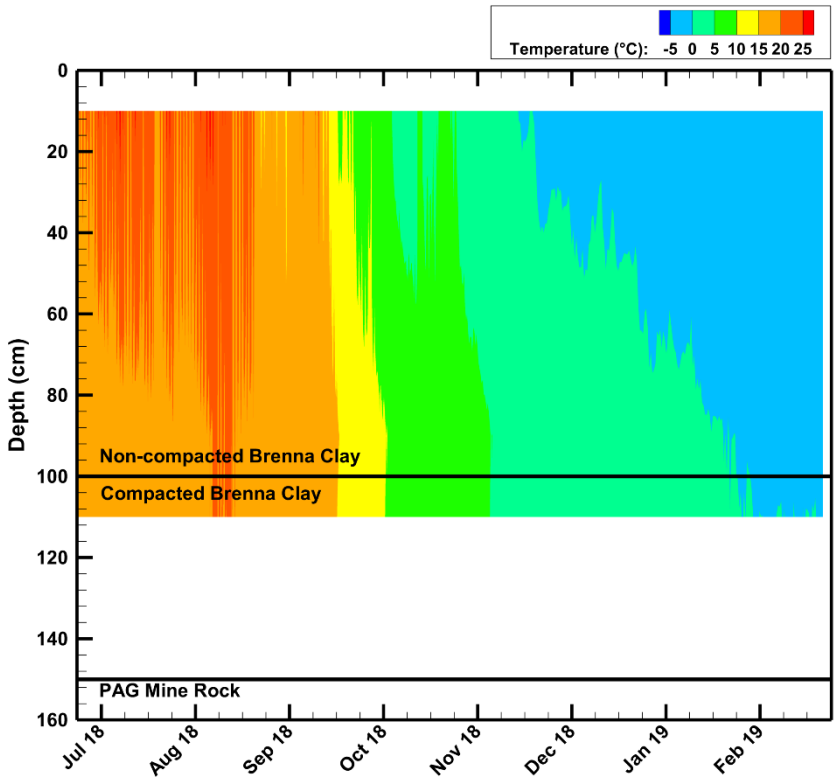

Figure 8: *In situ* soil temperature profile measured at Trial #2 Secondary Nest.

Oxygen Concentration:

Oxygen sensors were placed in the underlying waste rock and directly above the CBC layer to observe the consumption and ingress of oxygen. Prior to installation of the automated DAS, manual voltage measurements were taken periodically by New Gold personnel. Figure 9 shows observed oxygen concentrations below the CBC layer at Trial #1 Primary Nest. Oxygen concentrations in the other instrumented nests showed similar trends as shown in Figure 9. Oxygen concentrations are presented in Attachment A.

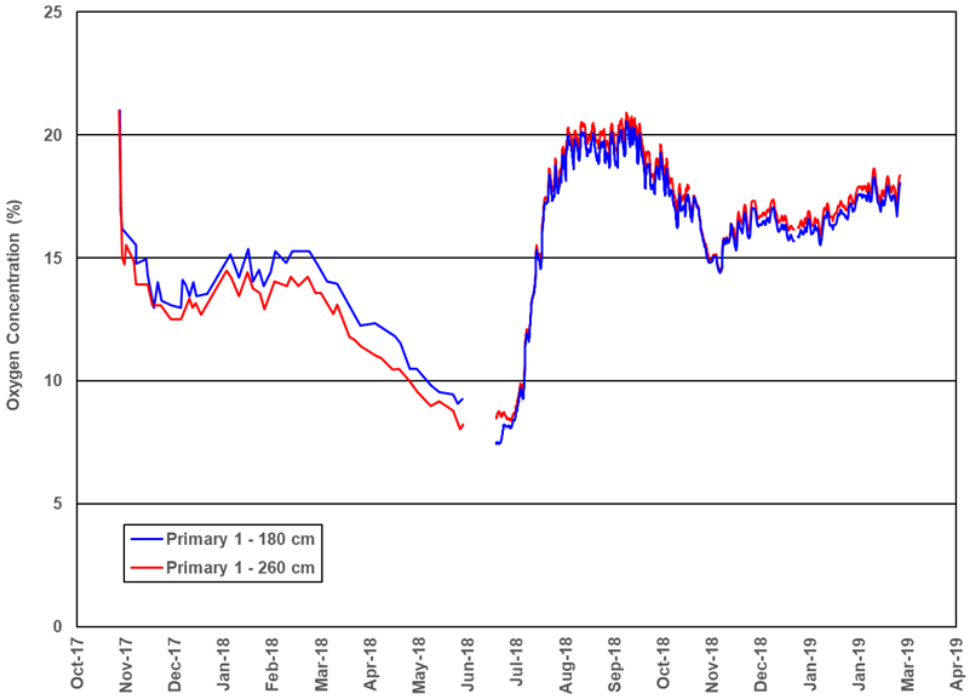

Figure 9: Oxygen concentration in waste rock below CBC layer at Trial #1 Primary Nest.

Manual Oxygen Sampling:

On November 12, 2018, OKC personnel installed ten manual gas sampling stations into the waste rock to verify measurements of the *in situ* oxygen sensors. Table 2 presents the results of oxygen concentrations collected from gas sampling. Some stations measured atmospheric oxygen concentrations immediately after installation due to the bentonite chip not yet moisturizing and sealing the hole. The oxygen concentration at Station TP1-8 measured atmospheric on March 4, 2019 and is thought not to be fully sealed. Additional benitoite will be added during spring in attempts to seal the station.

Table 2: Oxygen concentrations from manual sampling.

Station ID	O_2 (Nov. 13, 2018) (%)	O_2 (Nov. 14, 2018) (%)	O_2 (March 4, 2019) (%)
TP1-1	15.3	15.0	17.6
TP2-2	20.5	20.9	17.8
TP1-3	20.5	20.9	17.2
TP2-4	20.5	20.8	19.4
TP2-5	16.4	16.0	17.9
TP1-6	20.0	20.9	17.2
TP2-7	20.9	20.9	19.1
TP1-8	16.5	19.3	20.9
TP1-9	15.6	15.1	17.3
TP2-10	15.6	15.4	17.8

Snow Survey:

On March 4, 2019, a snow survey was conducted by OKC personnel to measure the depth of the snow pack on each cover system field trial. The trial was split into three transects (one running north to south on each trial and one running east to west across the entire trial). Survey locations and corresponding snow pack depths are illustrated in Figure 10.

Overall, Trial #1 observed a much greater snow pack on the plateau. This is mainly due to the tall vegetation acting as a snow catch on Trial #1 as compared to the bare surface of Trial #2. The large snow packs found on the east and southeast slopes can be attributed to snow blowing off the bare plateau and accumulating on the side slopes.

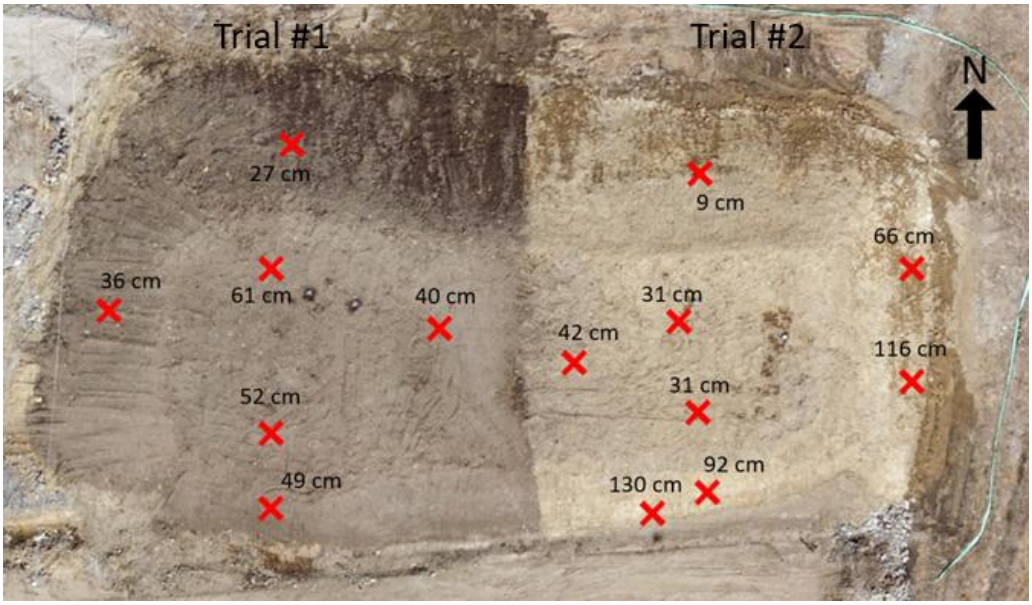

Figure 10: Snow survey locations and snow pack depths.

Summary:

The on-going monitoring of the cover system field trial will provide opportunities to understand the behavior and performance of each cover system and to evaluate the cover systems ability to mitigate the ingress of oxygen. Based on the above data analysis, the following points can be summarized:

- On average, the degree of saturation of the CBC layer is 96%.
- The freezing regime reached a depth of 30 cm and 110 cm on Trial #1 and Trial #2, respectively. This difference is due to the deeper snow pack on Trial #1 providing insulation from the ambient temperatures.
- The snow pack on Trial #1 was regularly consistent having an average depth of approximately 44 cm on the plateau and slopes. Trial #2 experienced limited snow on the plateau and a large snow pack on the south and southeast slopes. Vegetation on the Trial #1 provided a snow catchment, while snow on Trial #2 was exposed to wind gusts which allowed for snow to drift from the plateau to the side slopes.
- It is recommended that instrumentation monitoring, and manual gas sampling continue through 2019, including submission of quarterly factual data reports to New Gold in the form of PowerPoint presentations.

Closure:

We trust information provided in this memorandum is satisfactory for your requirements. Please do not hesitate to contact me at (403) 862-7711 or ghay@okc-sk.com should you have any questions or comments.

December 2018

Introduction

New Gold Inc. (New Gold) is currently operating and will eventually reclaim an open pit and underground gold mine, the Rainy River Mine (RRM). Through the Environmental Assessment process for construction and operation of the RRM, New Gold committed to an offsite well water quality program. The condition states:

> *A groundwater level (flow) and quality monitoring program of regular sampling and dipping of dedicated monitoring wells will be implemented to confirm that no area wells are affected by the mine. Furthermore, local well owners will be asked to participate in a well water quality program to monitor water quality in their wells.*

Water Chemistry Summary

One offsite groundwater sampling program was completed in September-October 2018 with nine local wells participating. The 2018 sample results will be compared against 2017 sample results and the same groundwater quality standards that the wells on the mine site are compared against.

All groundwater results were within the Provincial Water Quality Guidelines of Ontario (PWQO) standards except for phosphorus, copper, iron, uranium, and zinc. Results highlighted in red exceeded the PWQO. Please note, all samples were collected at a location representative of the water quality directly in the well. No samples were collected from a location that could be affected by a water treatment system in the residence.

In Summary;

- OF01 had elevated levels of cadmium, copper, lead and zinc.
- OF02 had elevated levels of iron.
- OF03 had elevated levels of copper, iron and zinc.
- OF04 had elevated levels of copper, lead and zinc.
- OF05 had elevated levels of copper, iron, lead and zinc.
- OF06 was not sampled as owner was not available.
- OF07 had elevated levels of cobalt, iron and zinc.
- OF08 had elevated levels of cobalt, iron and zinc.
- OF09 had elevated levels of iron.
- OF10 was not sampled at instruction of owner.
- OF11 had elevated levels of copper and zinc.

Table 1 displays all water chemistry results for 2018. Figures 1 through 6 show each parameter that measured higher than the Provincial Water Quality Guidelines of Ontario. Individual well result summaries are available in Table 2. Results highlighted in red exceeded the PWQO.
